-----------------------------------	-----

INTRODUCTION

The 2005-06 National Family Health Survey (NFHS-3) is the third in the NFHS series of surveys. The first NFHS was conducted in 1992-93, and the second (NFHS-2) was conducted in 1998-99. All three NFHS surveys were conducted under the stewardship of the Ministry of Health and Family Welfare (MOHFW), Government of India. The MOHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-3 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation, UNICEF, UNFPA, and the Government of India. Technical assistance for NFHS-3 was provided by Macro International, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

NFHS-3 interviewed 3,681 women age 15-49 and 1,329 men age 15-54 to obtain information on population, health, and nutrition in Punjab. The survey is based on a sample of 2,968 households that is representative at the state level and for the urban and rural population of the state. The household response rate in the state as a whole was 98 percent and the individual response rates were 94 percent for eligible women and 82 percent for eligible men.

The survey provides trend data on key indicators and includes information on several new topics, such as HIV/AIDS-related behaviour, attitudes toward family life education for girls and boys, use of Integrated Child Development Scheme (ICDS) services, men's involvement in maternal care, and health insurance. For the first time, NFHS-3 also provides information on men and unmarried women. In addition, NFHS-3 provides estimates of HIV prevalence for India as a whole based on blood samples collected in every state in the country, including Punjab. Separate HIV estimates are also provided for Andhra Pradesh, Karnataka, Maharashtra, Manipur, Tamil Nadu, and Uttar Pradesh.

In Punjab, women age 15-49 were interviewed from all the selected households; however, men age 15-54 were interviewed only from a subsample of households. In addition to the interviews, height and weight measurements were taken for all children under age six years in the sample households and all interviewed women and men. Haemoglobin levels were measured for all interviewed women and men and for all children age 6-59 months in the sample households. All interviewed women and men from a subsample of households selected for HIV testing were eligible to have their blood collected for HIV testing. Volume II of the National Report provides details of the sampling procedure. The NFHS-3 fieldwork in Punjab was conducted by the Centre for Research in Rural and Industrial Development (CRRID), Chandigarh, from December 2005 to March 2006.

This report presents the key findings of the NFHS-3 survey in Punjab, followed by detailed tables and an appendix on sampling errors. More information about the definitions of indicators included in this report is contained in Volume I of the NFHS-3 National Report, and questionnaires and details of the sampling procedure for NFHS-3 are contained in Volume II of the NFHS-3 National Report (available at www.nfhsindia.org).

HOUSEHOLD CHARACTERISTICS

Household composition

About two-fifths of Punjab's households are in urban areas, and the remaining three-fifths are in rural areas. On average, households in Punjab are comprised of five persons. About 1 in 10 households (11%) is headed by a woman.

Most households in Punjab have household heads who are either Sikh (53%) or Hindu (43%). Only 3 percent of households have a Muslim head of household; the remaining 2 percent of households have household heads belonging to other religions.

Thirty-two percent of household heads belong to a scheduled caste and 10 percent belong to other backward classes (OBC). More than half of Punjab's households do not belong to the scheduled castes, scheduled tribes, or other backward classes. In Punjab, virtually no household heads (0.1%) belong to the scheduled tribes.

Less than one-third of the population in Punjab (30%) is under age 15; only 7 percent is age 65 and over. The overall sex ratio of the population is only 882 women per 1,000 men, and the sex ratio of the population under 7 years of age is even lower (746).

Among children under 18 years of age, 4 percent have experienced the death of one or both parents. In all, 87 percent of children less than 18 years of age live with both parents, 10 percent live with only one parent, and the remaining 3 percent live with neither parent.

Housing characteristics

Sixty-nine percent of households in Punjab live in a *pucca* house. Ninety-six percent of households (95% of rural and 98% of urban households) have electricity, unchanged since NFHS-2. Twenty-nine percent of households have no toilet facilities, down from 49 percent at the time of NFHS-2. Forty-four percent of rural households have no toilet facilities.

.....
Although all households in Punjab use an improved source of drinking water, only 44 percent have water piped into their dwelling, yard, or plot.
.....

All households in Punjab use an improved source of drinking water, but only 44 percent have water piped into their dwelling, yard, or plot. Eleven percent of households treat their drinking water to make it potable: 4 percent boil the water, 2 percent use ceramic, sand, or other filters, 1 percent strain the water through a cloth, and 5 percent treat the water in some other way.

Over half of households use solid fuels for cooking, mainly in the form of dung cakes and wood. One-third of households own agricultural land. Virtually all households who own agricultural land have at least some irrigated land.

Wealth Index

The wealth index is constructed by combining information on 33 household assets and housing characteristics such as ownership of consumer items, type of dwelling, source of water, and availability of electricity into a single index. The household population is divided into five equal groups of 20 percent each (quintiles) at the national level from 1 (lowest, poorest) to 5 (highest, wealthiest). Since the quintiles of the wealth index are defined at the national level, the proportion of households or population of a particular state that falls in any specific quintile will vary across states.

Wealth Index

Percentage of households in urban and rural areas and percent distribution of households by wealth quintile

Based on the wealth index, households in Punjab are wealthier than households in India as a whole. More than two-fifths of Punjab's households (65% of urban households and 32% of rural households) are in the highest wealth quintile. Only 1 percent of households in Punjab (less than 1% of urban households and 2% of rural households) are in the lowest wealth quintile, compared with 20 percent in the nation as a whole.

EDUCATION

Current school attendance among children

In Punjab, 88 percent of primary-school age children (6-10 years) attend school (85% in urban areas and 89% in rural areas). School attendance drops to 82 percent for children age 11-14 years and is only 49 percent for children age 15-17 years.

In the rural areas of Punjab, a higher proportion of boys than girls attend school. The gender disparity in school attendance in rural areas increases with age from 3 percentage points in the age group 6-10 years to 10 percentage points in the age group 15-17. In urban areas, by

Are there gender differentials in children's current school attendance?

Percentage of children attending school by age

contrast, a higher proportion of girls than of boys attend school in all age groups, and the gender differential increases from 1 percentage point in the age group 6-10 to 8 percentage points in the age group 15-17.

Literacy and educational attainment

In NFHS-3, literate persons are those who have either completed at least standard six or ‘passed’ a simple literacy test conducted as part of the survey. According to these measures 69 percent of women age 15-49 and 83 percent of men age 15-49 are literate in Punjab.

Twenty-nine percent of women and 14 percent of men age 15-49 have never been to school. Forty-one percent of men and 38 percent of women have completed 10 or more years of education.

.....

Only 41 percent of men and 38 percent of women age 15-49 years have 10 or more years of education in Punjab.

.....

Attitudes toward family life education in school

Virtually all women and men in Punjab agree that children should be taught moral values in school. Most adults also think that children should learn about the changes in their own bodies during puberty, but fewer think that boys should learn about puberty-related changes in the bodies of girls. Fewer women, but the same proportion of men, think that girls should learn about puberty-related changes in the bodies of boys than about changes in their own bodies.

Men are twice as likely (75-76%) to believe that girls and boys should learn about contraception in school than women (35-38%). Almost 9 in 10 men and 2 in 3 women think that boys and girls should learn about HIV/AIDS in school. The vast majority of men also believe that information on sex and sexual behavior and information on condom use to avoid sexually transmitted diseases should be part of the school curriculum. However, a minority of women feel that these are appropriate topics for school children.

FERTILITY

Age at first marriage

The median age at first marriage in Punjab is 19.8 years among women age 20-49 and 23.5 years among men age 25-49 years. On average men get married about four years later than women. One-fifth of women age 20-24 years got married before the legal minimum age of 18, and 27 percent of men age 25-29 years got married before the legal minimum age of 21.

Fertility levels

At current fertility levels, a woman in Punjab will have an average of 2.0 children in her lifetime. Fertility in the urban areas is lower than replacement (1.9); however, even in the rural areas of the state, fertility is at replacement level (2.1). Among births in the three years preceding the survey, only 12 percent were of birth order four or higher.

Fertility has declined by almost one child since the time of NFHS-1. However, most of this decline occurred between NFHS-1 and NFHS-2. Between NFHS-2 and NFHS-3, fertility declined only marginally by 0.2 children.

While Sikh women have fertility which is lower than replacement, fertility among Hindus in Punjab is just at replacement level. Scheduled-caste women have much higher fertility than women not belonging to the scheduled castes, scheduled tribes, or other backward classes.

Fertility Trends

Total fertility rate
(children per woman)

Total Fertility Rate by State

Children per woman

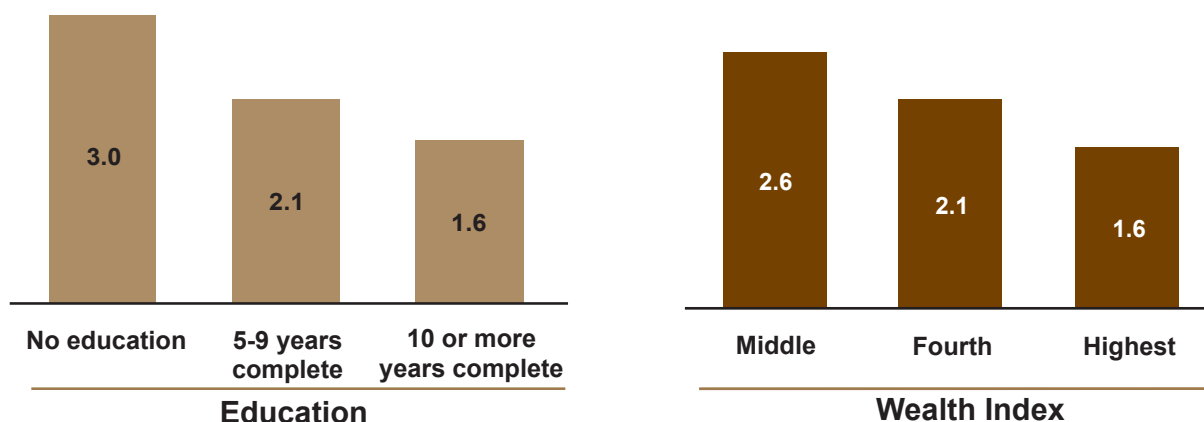

Fertility is at or below replacement level in Punjab as a whole as well as in its urban and rural areas.

The greatest differentials in fertility in Punjab are by wealth and education, however. At current fertility rates, women with no education will have 1.3 children more than women with 10 or more years of schooling (a TFR of 3.0, compared with 1.6). Similarly women in the middle wealth quintile will have one child more than women in the highest wealth quintile (a TFR of 2.6, compared with 1.6).

How does fertility vary with education and household wealth?

Total fertility rate (children per woman)

Note: Categories with fewer than 125 unweighted woman-years of exposure are not shown.

Teenage pregnancy

Among young women age 15-19, 6 percent have already begun childbearing—much lower than the national average (16%). One percent of women age 15 have started childbearing, but among women age 19, almost one-fifth (18%) are already mothers or are pregnant. The percentage of young women who have begun childbearing declines sharply with education, from 18 percent among those with no education to 2 percent among those with 10 or more years of education.

Birth intervals

The median interval between births in Punjab is 30 months, about the same as the national average of 31 months. Eighteen percent of births take place within 18 months of the last birth, and 35 percent occur within 24 months. Almost two-thirds of births occur within three years. Research shows that waiting at least three years between children reduces the risk of infant mortality.

Fertility preferences

Seventy-nine percent of currently married women and 76 percent of currently married men in Punjab want no more children or are already sterilized or have a husband who is sterilized. Among those who do want another child, about one-third of women and half of men would like to wait at least two years. Eighty-one percent of women and men in Punjab consider the ideal family size to be two children or less.

As in many other states of India, there is evidence of a preference for sons in Punjab. Eighteen percent of women and 13 percent of men want more sons than daughters, but only 2 percent of women and men want more daughters than sons. However, most men and women would like to have at least one son and most would like to have at least one daughter.

The desire for more children is also affected by women's number of sons. For example, among currently married women with two children, 97 percent of women with two sons and 95 percent with one son want no more children, compared with 43 percent of women with two daughters only. Notably, however, the proportion of women with two daughters and no sons who want no more children has almost doubled since NFHS-1. Also, the proportion of women with two children who want no more children has increased considerably in the period between NFHS-1 and NFHS-3, although most of this increase took place between NFHS-1 and NFHS-2.

How does son preference affect women's desire for children?

Percentage of currently married women with two children who want no more children

In Punjab, unplanned pregnancies are relatively common. If all women in Punjab were to have only the number of children they wanted, the total fertility rate would be 1.5 instead of 2.0.

FAMILY PLANNING

Knowledge of family planning methods

Knowledge of contraception is almost universal in Punjab. Female sterilization is the most widely known method among all women and the condom is the most widely known method

How many women know about family planning?

Percentage of currently married women

among all men. The government family planning programme promotes three temporary methods: the pill, IUD, and condoms. Of these three methods, currently married women are most likely to know about the pill (92%) and currently married men are most likely to know about condoms (99%).

Knowledge of all contraceptive methods, including female sterilization, has decreased in Punjab in the seven years since NFHS-2. For example, 97 percent of currently married women knew about the pill, as also the IUD and the condom, at the time of NFHS-2; in NFHS-3, only 92 percent of women know

about the pill, 89 percent know about the IUD, and 90 percent know about condoms. Knowledge of the rhythm method and withdrawal has declined even more sharply between NFHS-2 and NFHS-3 than knowledge of modern methods.

Contraceptive use

The contraceptive prevalence rate among currently married women is 63 percent, down from 67 percent in NFHS-2. Female sterilization accounts for almost half of contraceptive use. Contraceptive use is slightly higher in rural areas (64%) than in urban areas (62%). Contraceptive prevalence increases with age to 75 percent among women age 30-39 and then declines.

In keeping with son preferences, women in Punjab are more likely to use contraception if they already have a son. For example, 77 percent of women with two sons but no daughters use a method of family planning, compared with only 45 percent of women with two daughters but no sons.

How many women use family planning?

Percentage of currently married women

Contraceptive Prevalence Rate by State

Percentage of currently married women

Contraceptive use in Punjab is higher than the national average, but lower than in Himachal Pradesh, its neighbour.

Contraceptive use in Punjab does not vary greatly by most background characteristics. The only groups among whom contraceptive use is particularly low are Muslim women (49%) and women who have less than five years of education (57%). The only women with a much higher than average contraceptive prevalence rate are women who are employed for cash (72%).

The most commonly used spacing method by currently married women in Punjab are condoms (16%), followed by the IUD (6%). In general, better-educated and wealthier women and women from urban areas are more likely to use modern spacing methods. Female sterilization is more common among less educated and disadvantaged women.

Contraceptive prevalence has decreased from 67 percent in NFHS-2 to 63 percent in NFHS-3; however, the use of condoms and female sterilization has increased during the same period. The decline is sharpest in traditional method use, but the use of male sterilization, the pill, and the IUD has also declined or remained unchanged in the years between NFHS-2 and NFHS-3. Female sterilization, which accounted for 44 percent of contraceptive use in NFHS-2, now accounts for 49 percent of contraceptive use.

Contraceptive use at last sex as reported by men is only somewhat lower than women's report of contraceptive use. Fifty-seven percent of currently married men report using contraception the last time they had sex.

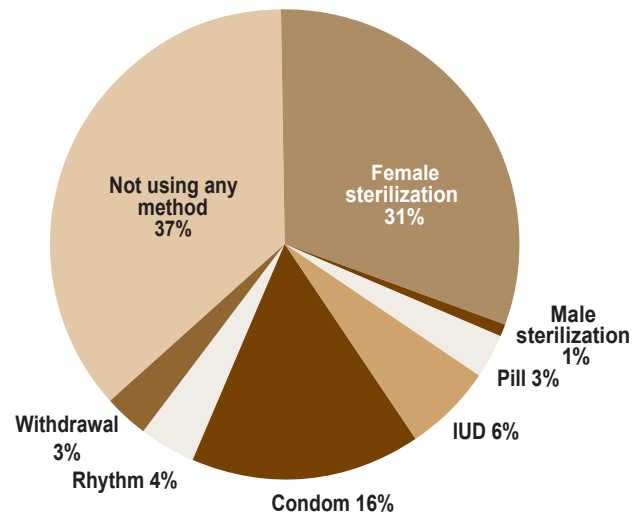

Ninety-two percent of sterilized women had the operation in a government facility, most often in a government or municipal hospital, whereas more than half of IUD users had their IUD insertion in the private medical sector. Almost two-thirds of pill users got their most recent supply from the private medical sector, which is also the most common source for condoms. However, 8 percent of pill users and 18 percent of condom users did not mention any source but said that they obtained their supply from their husband.

According to women's reports, among users for whom the brand is known 66 percent of pill users and 51 percent of condom users use social marketing brands. According to the men's reports, 44 percent of condom users for whom the brand is known use social marketing brands.

The one-year discontinuation of contraceptive methods is lower in Punjab (20%) than in the country as a whole (27%). One-fourth of all users of spacing methods discontinued use within the first year after they adopted the method, compared with the national average of 39 percent. Fifteen percent of IUD users and 26 percent of condoms users discontinued use within the first year of use.

What contraceptive methods do women use?

Currently married women

Informed choice

Women who know about several contraceptive methods and their side effects can make better choices about what method they would prefer to use. Thirty-seven percent of women using a modern contraceptive method were told by a health or family worker about the side effects of their method, 29 percent were told what to do if side effects occurred and 32 percent were told about other methods they could use.

Men's attitudes

Most men in Punjab (84%) reject the idea that contraception is women's business and a man should not have to worry about it and reject the idea that women using contraception may become promiscuous (88%). However, 48 percent of men incorrectly believe that women who are breastfeeding cannot become pregnant and only 57 percent of men know that a condom, if used correctly, protects against pregnancy most of the time.

Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely but are not using contraception. According to this definition, 7 percent of currently married women in Punjab have an unmet need for family planning, down from 13 percent in NFHS-1, but unchanged since NFHS-2. Currently, 90 percent of the demand for family planning is being met in Punjab, higher than the national average of 82 percent.

INFANT AND CHILD MORTALITY

Infant mortality in NFHS-3 is estimated at 42 deaths before the age of one year per 1,000 live births, down from the NFHS-2 estimate of 57. The under-five mortality rate for Punjab is 52 deaths per 1,000 live births, down from the NFHS-2 estimate of 72. The NFHS-3 rates imply that, despite declining mortality, more than 1 in 24 children in Punjab still die within the first year of life, and 1 in 19 die before reaching age five.

Infant mortality does not vary greatly between the urban and rural areas of Punjab. Children whose mothers have no education are more than one and half times as likely to die before their first birthday as children whose mothers have completed at least 10 years of school.

After the first month of life and before they are five years old, girls in Punjab face a much higher mortality risk than boys. The child mortality rate by sex shows that the gender differential in mortality is particularly high for children above the age of one year. The child mortality rate for girls is 16 deaths per 1,000 children age 12-59 months, compared with only 6 for boys.

Trends in Infant Mortality

Deaths per 1,000 live births

Children born to mothers younger than 20 years or over 40 years of age are more likely to die in infancy than children born to mothers in the prime childbearing age. Infant mortality is 60 per 1,000 for teenage mothers, compared with 40 for mothers age 20-29.

Having children too close together is especially risky. Children born less than two years after a previous birth are more likely to die than children whose mothers waited 2-3 years between births.

PERINATAL MORTALITY

Perinatal mortality, which includes stillbirths and very early infant deaths (in the first week of life), is estimated at 33 deaths per 1,000 pregnancies that lasted 7 months or more. Perinatal mortality is somewhat higher in rural than in urban areas. Pregnancy intervals also have a strong effect on perinatal mortality. The perinatal mortality rate is much higher (44 per 1,000) for pregnancies that take place less than 15 months after the previous birth than for pregnancies that take place at least 39 months after the previous birth (28 per 1,000).

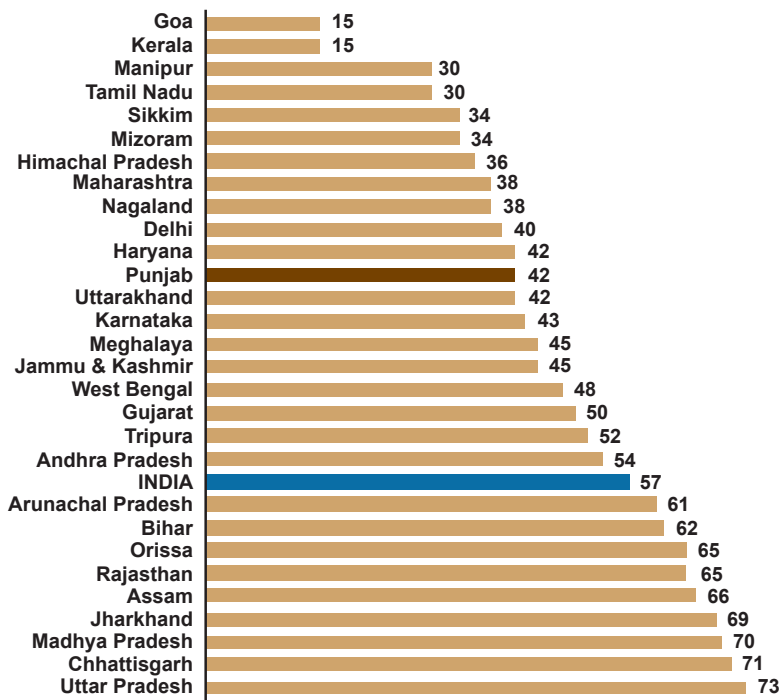

High-risk births have higher mortality rates

Deaths in the first year of life per 1,000 live births

Infant Mortality Rate by State

Deaths per 1,000 live births

Despite recent declines, infant mortality in Punjab remains relatively high.

MATERNAL HEALTH

Antenatal care

Among women who gave birth in the five years preceding the survey, 83 percent received antenatal care from a health professional (56% from a doctor, 26% from an ANM/LHV/nurse/midwife, and 1% from other health personnel). One in ten women received no antenatal care for their last birth in the last five years. Urban women were somewhat more likely than rural women to receive antenatal care, particularly from a doctor.

Almost all women with 10 or more years of education and women in the highest wealth quintile received antenatal care. Notably however, 38 percent of women belonging to the second wealth quintile, 22 percent of women with no education and women belonging to the middle wealth quintile, and 21 percent of women having a fourth or higher order birth did not receive any antenatal care.

Sixty percent of women received antenatal care during the first trimester of pregnancy, as is recommended. Another 20 percent had their first visit during the fourth or fifth month of pregnancy (data not shown in tables). Three-fourths of mothers had three or more antenatal care visits; urban women were more likely to have three or more visits than women in rural areas.

Three or More Antenatal Care Visits by State

Percentage of last births in the past five years

Despite relatively high antenatal care coverage in Punjab, one in four women still do not receive at least three antenatal care visits during pregnancy.

The proportion of ever-married women with a birth in the three years before each survey who received any antenatal care for their last birth has increased by 16 percentage points between NFHS-2 and NFHS-3: from 75 percent to 91 percent. There has also been a considerable increase in the proportions of women with at least three antenatal care visits and women who had their first antenatal care visit in the first trimester of pregnancy (14-15 percentage points each) in the seven years between the surveys.

However, even when women receive antenatal care, they do not always receive several of the services needed to monitor their pregnancy. Only 72-76 percent each of women who received antenatal care had their abdomen examined, urine tested, blood tested, and blood pressure measured, and even fewer had their weight taken (60%). Only 18-28 percent of women who received any antenatal care were told about pregnancy complications and 59 percent were told where to go if they experienced pregnancy complications.

Among women having a live birth in the five years preceding the survey, mothers received iron and folic acid supplements (IFA) for 66 percent of births; however, they consumed IFA for the recommended 90 days or more for only 28 percent of births. More than four in five mothers received two or more doses of tetanus toxoid vaccine. Only 3 percent took a deworming drug during pregnancy.

An ultrasound test was performed during 45 percent of pregnancies, much higher than the national average of 24 percent. Two-thirds of pregnancies to women with 10 or more years of education and women belonging to the highest wealth quintile had an ultrasound test. Women with at least 10 years of education were almost three times as likely to have an ultrasound test as women with no education. Pregnant women having one or two children but no living son are more likely to have an ultrasound test.

Delivery care

Almost half of the births in Punjab take place at home and half in a health facility. Among births in the five years preceding the survey, 65 percent of first births were institutional births, compared with only 27 percent of births that were of order 4 or higher.

The proportion of births in health facilities increases sharply with the education and wealth status of the mother. About three out of four deliveries of mothers who have 10 or more years of education and who belong to the highest wealth quintile take place in a health facility. Institutional births are also more common among urban women, Sikh women, and women who received four or more antenatal care visits. Institutional births increase sharply with the wealth status of the household.

Are mothers getting timely, appropriate antenatal care?

Percentage of last births in the past three years

The percentage of institutional births among all births in the three years preceding each survey has increased steadily from 25 percent in NFHS-1 and 38 percent in NFHS-2, to 53 percent in NFHS-3.

Home births are more common among women who received no antenatal check-ups, rural women, women with no education, scheduled caste women, older women, and women with more than three previous births. Women who gave birth at home were asked why they did not deliver in a health facility; by far the most common reason was that they simply felt it was not necessary (70%), followed by the reason that an institutional delivery is too expensive (28%; data not shown in tables). In 84 percent of home births, a clean blade was used to cut the cord, as is recommended, and 87 percent of home births followed the recommendation that the baby be immediately wiped dry and then wrapped without being bathed first.

Sixty-eight percent of births took place with assistance from a health professional, and 31 percent were delivered by a traditional birth attendant. Only 35 percent of home deliveries were assisted by a health professional. A disposable delivery kit (DDK) was used for seven in ten home births.

Are babies being delivered safely?

Percentage of births in the past three years

Institutional Delivery by State

Percentage of births in the past five years

Despite improvements in maternal care, only one out of two births in Punjab is an institutional birth.

Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. The majority of mothers in Punjab (62%) had a postnatal check-up within two days of birth, as is recommended. More than one-third of women (35%) received no postnatal care for their last birth in the past five years. Postnatal care is most common following births in a medical facility; however, 11 percent of births in medical facilities were not followed by a postnatal check-up of the mother. Only one-third of home births were followed by a postnatal check-up.

Male involvement in maternal care

Among men with a child under three years, whose mother had at least one antenatal check-up, about 58 percent said they were present during at least one of the antenatal check-ups; and 52 percent were told what to do if the mother had a pregnancy complication.

The majority of fathers in Punjab with a child less than three years of age were provided information related to delivery care. Two-thirds were told about the importance of proper nutrition for the mother during pregnancy and 64 percent were told about the importance of delivering the baby in a health facility. Among fathers whose child was not delivered in a health facility, 63 percent were told about the importance of using a new or unused blade to cut the umbilical cord and 67-69 percent each were told about the importance of cleanliness at the time of delivery, the importance of breastfeeding the baby immediately after birth and about keeping the baby warm immediately after birth.

CHILD HEALTH

Vaccination of children

Sixty percent of children age 12-23 months are fully vaccinated against six major childhood illnesses: tuberculosis, diphtheria, pertussis, tetanus, polio, and measles. However, most children are at least partially vaccinated: only 7 percent have received no vaccinations at all. Eighty-eight percent of children have received a BCG vaccination, 78 percent have been vaccinated against measles, 76 percent have received at least the recommended three doses of polio vaccine and 71 percent have received all the recommended doses of DPT.

The DPT and polio vaccines are given in a series. Many children receive the first dose but do not finish the series. Between the first and third doses, the dropout rate in Punjab for polio is 16 percent and the dropout rate for DPT is even higher at 18 percent. In spite of the Pulse Polio Campaign and attempts to eradicate the disease in India, about one-quarter of children in Punjab still have not received three doses of the polio vaccine.

There is a large gender differential in vaccination coverage in Punjab. Only 54 percent of girls age 12-23 months, compared with 65 percent of boys in the same age group are fully vaccinated. Girls are also much less likely than boys to have received each one of the recommended vaccinations.

While there has been an increase in full vaccination coverage in the nation as a whole between NFHS-2 and NFHS-3, Punjab has experienced a considerable decline in full vaccination coverage from 72 percent of children age 12-23 months fully vaccinated in NFHS-2 to 60 percent in NFHS-3. The present level is even lower than that in NFHS-1 (62%). The decline in full vaccination coverage between NFHS-2 and NFHS-3 in Punjab is accompanied by sharp declines (8-11 percentage points) in the coverage of three doses of the DPT and polio vaccines and little or no improvement in the coverage of the measles and BCG vaccines during the same period.

Trends in Vaccination Coverage

Percentage of children 12-23 months receiving vaccinations

Girls age 12-23 months in Punjab are 17 percent less likely than boys in the same age group to be fully immunized and are also less likely to have received each one of the recommended vaccinations.

First-born children, children in urban areas, children of educated mothers, and children in wealthier households are more likely than other children to be fully vaccinated. Less than half of children belonging to the scheduled castes, children of mothers with no education, and children belonging to the middle wealth quintile have been fully vaccinated.

Full Immunization Coverage by State

Percentage of children 12-23 months

Full immunization coverage in Punjab has declined since NFHS-2, but remains higher than the national average.

Childhood illnesses

In the two weeks before the survey, 7 percent of children under age five had symptoms of an acute respiratory infection (cough and short, rapid breathing that was chest-related and not due to a blocked or runny nose). Of these children, 87 percent were taken to a health facility or health provider. Fifteen percent of children under age five were reported to have had fever in the two weeks preceding the survey; 84 percent of these children were taken to a health facility or provider for treatment, and 8 percent received antimalarial drugs.

Overall, 8 percent of children had diarrhoea in the two weeks preceding the survey. Among these children, three-fourths were taken to a health facility. Thirty-nine percent were treated with some kind of oral rehydration therapy (ORT), including 34 percent who were treated with a solution prepared from oral rehydration salt (ORS) packets and 16 percent who were given gruel. ORS use in treating diarrhoea among children remains very low, even though about three out of four (73%) mothers of young children have heard of ORS.

About one-third of children with diarrhoea did not receive any type of treatment at all. Sixteen percent received antibiotics, which are not normally recommended for treating childhood diarrhoea.

Children should receive more fluids than usual during diarrhoeal illness, but in Punjab, only 1 percent received more liquids than normal. Thirty-eight percent of children with diarrhoea received less to drink than normal, which can increase the risk of dehydration.

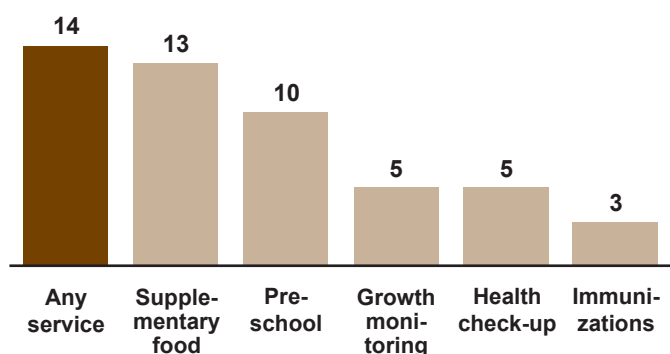

Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age 6 years and pregnant or breastfeeding women, as well as preschool activities for children age 3-6 years. These services are provided through community-based *anganwadi* centres. Among the 65 percent of children under age six who are in areas covered by an *anganwadi* centre, only 14 percent have received services of some kind from a centre.

The most common services children receive are supplementary food (13% of children under age 6 years) and early childhood care and preschool services (10% of children age 3-6 years). Five percent each of children have received health check-ups and growth monitoring services at an *anganwadi* centre.

How many children receive *anganwadi* centre services?

Percentage of age-eligible children in areas covered by an *anganwadi* centre receiving services

Children 2-4 years are slightly more likely to receive services from an *anganwadi* centre than younger and older children. About one in five children from scheduled castes and children belonging to the lower wealth quintiles take advantage of the services offered at *anganwadi* centres.

Among children under age six years in areas covered by an *anganwadi* centre, only 8 percent had mothers who received any service from a centre during pregnancy, and even less (6%) had mothers who received any service when breastfeeding.

BREASTFEEDING, NUTRITION, AND ANAEMIA

Infant feeding

Although breastfeeding is nearly universal in Punjab, only 36 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. In addition, only 45 percent are put to the breast within the first day of life, which means many infants are deprived of the highly nutritious first milk (colostrum) and the antibodies it contains. However, mothers in Punjab breastfeed for an average of 22 months, which is slightly shorter than the minimum of 24 months recommended by WHO for most children.

It is recommended that nothing be given to children other than breast milk even in the first three days when the milk has not begun to flow regularly. However, 63 percent of children are given something other than breast milk during that period. WHO offers three recommendations for infant and young child feeding (IYCF) practices for those 6-23 months old: continued breastfeeding or feeding with appropriate calcium-rich foods if not breastfed; feeding solid or semi-solid food for a minimum number of times per day according to age and breastfeeding status; and, including foods from a minimum number of food groups per day according to breastfeeding status. Under one-third (31%) of children age 6-23 months are fed the recommended minimum times per day and 38 percent are fed from the appropriate number of food groups. Only 20 percent are fed according to all three recommended practices.

Vitamin A deficiency can cause eye damage and a higher risk of dying from measles, diarrhoea, or malaria. The Government of India recommends that children under three years receive vitamin A supplements every six months, starting at age 9 months. However, only 21 percent of last-born children age 12-35 months were given a vitamin A supplement in the past six months, and only 44 percent of children age 6-35 months ate vitamin A-rich foods during the day or night before the interview.

Eating foods rich in iron and taking iron supplements can prevent anaemia. Only 10 percent of children age 6-35 months ate iron-rich foods in the day and night before the survey, and only 5 percent of children age 6-59 months were given iron supplements in the week before the survey.

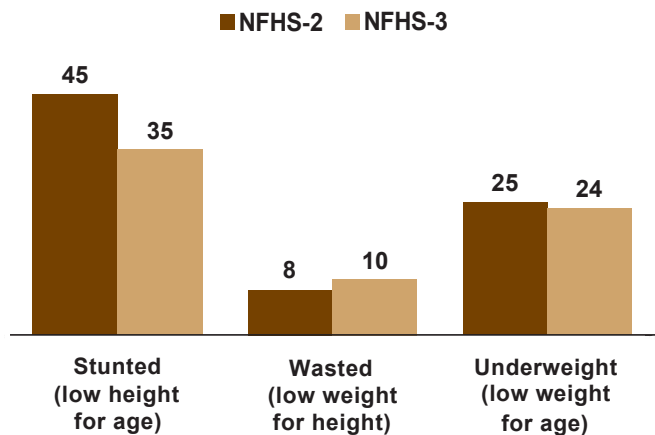

Children's nutritional status

Thirty-seven percent of children under age five are stunted, or too short for their age, which indicates that they have been undernourished for some time. Almost one in ten are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness. One-fourth are underweight, which takes into account both chronic and acute undernutrition.

Even during the first six months of life, when most babies are breastfed, 10-18 percent of children are undernourished according to each of these three measures. Children in rural areas are about equally likely to be stunted and wasted as children in urban areas and are slightly more likely than urban children to be underweight. Similarly girls and boys are about equally

Trends in Children's Nutritional Status

Percentage of children under three years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

likely to be wasted and stunted, but girls are marginally more likely to be underweight than boys.

Children's nutritional status in Punjab has improved slightly since NFHS-2 by some measures but not by all measures. Children under age three (the age group for which nutritional status data are available in NFHS-2) are less likely to be too short for their age, which means that chronic under-nutrition is less widespread, and about equally likely to be underweight. However, they are slightly more likely to be too thin for their height, which means acute under-nutrition is still a major problem in Punjab.

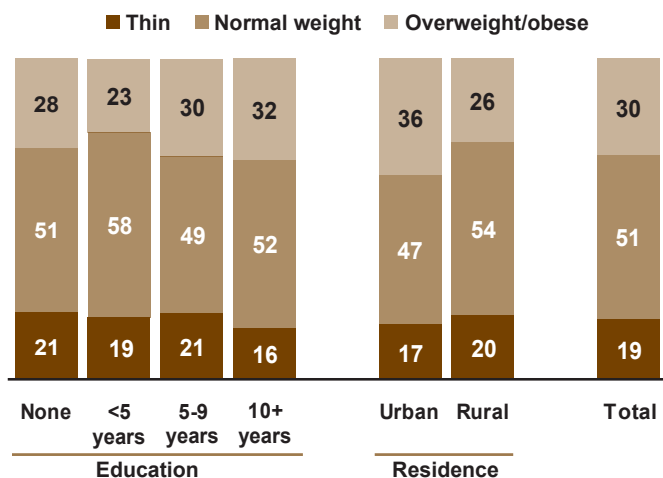

Adults' nutritional status

Adults in Punjab suffer from a dual burden of malnutrition; about one in five adults age 15-49 are too thin, and 30 percent of women and 22 percent of men are overweight or obese. Only 51 percent of women and 57 percent of men are at a healthy weight for their height. The percentage of ever-married women who are too thin has declined from 17 percent in NFHS-2 to 14 percent in NFHS-3.

Undernutrition is particularly serious in the youngest age group (15-19), among the never married, and those in the lower wealth quintiles. Overweight and obesity are most common in older adults, those in urban areas, and those in the highest wealth quintile. Because population groups that are less likely to be too thin are the same groups that are more likely to be overweight or obese, the percentage suffering from either of these two nutritional problems does not vary much across most population groups.

How many women are at a healthy weight for their height?

Percent distribution of women

Because population groups that are less likely to be too thin are the same groups that are more likely to be overweight or obese, the percentage suffering from either of these two nutritional problems does not vary much across most population groups.

Using iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Three-fourths of households in Punjab were using sufficiently iodized salt at the time of the survey. This is almost the same as the percentage observed during NFHS-2 (76%). However, a nationwide ban on non-iodized salt took effect just as the NFHS-3 fieldwork was being completed, so the effects of the new law could not be determined by the survey.

Anaemia

Anaemia is a major health problem in India, especially among women and children. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement.

Among children between the ages of 6 and 59 months in Punjab, the majority – 66 percent – are anaemic. This includes 22 percent who are mildly anaemic, 38 percent who are moderately anaemic, and 7 percent who suffer from severe anaemia. Boys are more likely to have anaemia than girls. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. More than 60 percent of children are anaemic even if their mother has 10 or more years of education or is in the highest wealth quintile. The prevalence of anaemia is relatively low, at 40 percent, only among children age 48-59 months.

Anaemia among Women, Men, and Children

Thirty-eight percent of women in Punjab have anaemia, including 26 percent with mild anaemia, 10 percent with moderate anaemia, and 1 percent with severe anaemia. Anaemia is particularly high for younger women, scheduled-caste women and women from the lower wealth quintiles. Women who are breastfeeding or who are pregnant are also more likely to have anaemia than women who are not pregnant or breastfeeding.

The prevalence of anaemia in Punjab has changed little since NFHS-2. While the prevalence of anaemia among ever-married women has declined slightly from 41 percent in NFHS-2 to 38 in NFHS-3, the prevalence of anaemia among children age 6-35 months has remained unchanged at 80 percent.

One in seven men are anaemic (14%). Men under age 20, rural men, men with no or little education, and men belonging to the middle and fourth wealth quintiles are more likely to suffer from anaemia than most other men.

HIV/AIDS

Awareness of AIDS

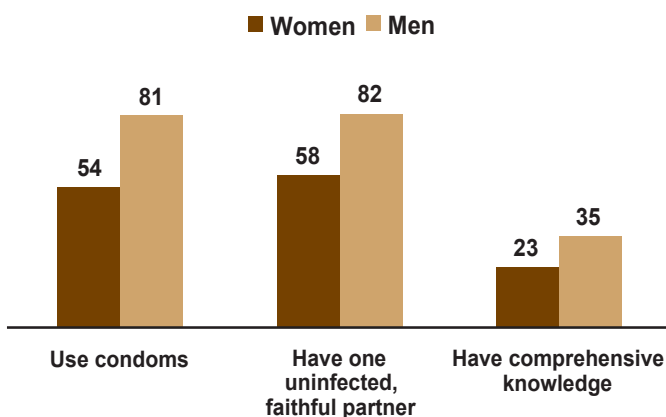

Just under three-fourths of women in Punjab have heard of AIDS (81% in urban areas and 70% in rural areas). Older women (age 30-49 years) are somewhat less likely than younger women to have heard of AIDS. More women know about AIDS now than in the late 1990s; among ever-married women interviewed in NFHS-2, 55 percent knew about AIDS, compared with 70 percent of ever-married women interviewed in NFHS-3.

Men are much more likely than women to know about AIDS. Ninety-two percent of men have heard of AIDS, including 93 percent in urban areas and 91 percent in rural areas. Men with no education are twice as likely to have heard of AIDS as women with no education (78% of men, compared with 39% of women).

Knowledge of prevention and transmission

Do people know how to prevent HIV/AIDS?

Percentage of women and men age 15-49

Men are much more likely than women to know how HIV is transmitted and how it can be prevented. For example, only 54 percent of women know that consistent condom use can help prevent HIV/AIDS, compared with 81 percent of men; and 58 percent of women know that having just one uninfected faithful partner can reduce the chance of getting HIV/AIDS, compared with 82 percent of men. Even in the rural areas and among those with little education, men are much more likely than women to know how HIV can be transmitted and prevented.

Only 23 percent of women and 35 percent of men have ‘comprehensive knowledge’ of HIV/AIDS. This means that they know that a healthy-looking person can have HIV/AIDS, that HIV/AIDS cannot be transmitted through mosquito bites or by sharing food, and that condom use and having only one faithful, uninfected partner can help prevent HIV/AIDS.

HIV-related stigma

Seventy percent of women and 79 percent of men in Punjab would be willing to take care of a family member with HIV/AIDS in their home. Almost three-fourths (72%) of women and men say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Seventy-one percent of men, but only 59 percent of women say that they are comfortable buying fresh vegetables from a shopkeeper with HIV/AIDS. More than two-thirds of women (69%) and three-quarters of men in Punjab say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret. Overall, however, only 35 percent of women and 46 percent of men express all four of these accepting attitudes towards persons living with HIV/AIDS.

HIV testing prior to NFHS-3, blood transfusions, and safe injections

Only 2 percent of women and 8 percent of men in Punjab age 15-49 had ever been tested for HIV prior to NFHS-3. While urban women are more likely than rural women to have been tested for HIV, urban and rural men are about equally likely to have been tested.

In Punjab, women (5%) are more likely than men (1%) to have ever had a blood transfusion. Women are, however, less likely than men to have received an injection from a health worker in the past year (34% of women, compared with 45% of men).

While the proportion of women and men who have ever received a blood transfusion is similar in urban and rural areas, the proportion who received an injection from a health worker in the past year is higher in rural than in urban areas. For more than nine-tenths of adults who received an injection from a health worker in the past 12 months, the last injection was 'safe', i.e., the syringe and needle were taken from a newly opened package or the needle used had been sterilized.

HIV prevalence

In Punjab, blood was collected for HIV testing from eligible women and men in a sub-sample of households. The results of the HIV testing of blood samples collected from Punjab contributed to the national HIV prevalence estimate; however, no separate estimate of HIV prevalence is available for the state.

Nationally, NFHS-3 found that 0.28 percent of adults age 15-49 are infected with HIV, including 0.35 percent in urban areas and 0.25 percent in rural areas. If the six states considered by the National AIDS Control Organization (NACO) as having high HIV prevalence are excluded, the HIV prevalence estimate for the remaining 23 states combined, including Punjab, is only 0.12 percent. In these 23 states combined, the prevalence among women and men age 15-49 is 0.08 and 0.16, respectively.

SEXUAL BEHAVIOUR

NFHS-3 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, and condom use. Additionally, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

Age at first sexual intercourse

Half of women age 25-49 first had sex before they were 20 years of age, and half of men in the same age group first had sex before they were 24. Among youth 15-24 years of age, women are more likely than men to have ever had sex (37% of women, compared with 29% of men). The earlier age at sexual intercourse for women than men is a consequence of the fact that first sexual intercourse largely occurs within marriage and women marry at younger ages than men.

Higher-risk sex and multiple sex partners

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who have ever had sex, only 0.4 percent of women and 12 percent of men reported having had higher-risk sex in the past year. Even fewer respondents said they had multiple sex partners in the past year (0.2% of women and 5% of men).

Use of condoms during higher-risk sex

About half of men (47%) who had higher-risk sex in the past 12 months reported using a condom the last time they had higher-risk sex. Condom use during higher-risk sex is more common among urban than rural men.

Paid sex

Two percent of men said they had paid for sex in the past 12 months.

ADULT HEALTH AND HEALTH CARE

Tuberculosis

In Punjab, 201 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. Persons living in households that use solid fuel for cooking are more than twice as likely to have tuberculosis as persons in household using other types of cooking fuels.

Most adults have heard of tuberculosis (88% of women and 92% of men), but even among people who have heard of tuberculosis, less than half know that it is spread through the air by coughing or sneezing. More than two-fifths of women (41%) and men (39%) have misconceptions about how tuberculosis is spread. However, most women and men know that tuberculosis can be cured (85% of women and 89% of men). Only 14 percent of women and 12 percent of men say that if a family member had tuberculosis, they would want to keep it a secret from the neighbours.

Diabetes, asthma, and goitre

According to self reports, about 1 percent of women and men age 15-49 suffer from diabetes. The prevalence of diabetes in the age group 35-49 is 2 percent each among women and men. About 1 percent of adults suffer from asthma (945 per 100,000 women and 802 per 100,000 men). The prevalence of goitre or other thyroid disorders is substantially higher for women than for men (601 per 100,000 women, compared with 241 per 100,000 men).

Tobacco and alcohol use

About one-third of men (34%), but only 1 percent of women, use some form of tobacco in Punjab. Most adults who use tobacco, smoke it in the form of cigarettes or *bidis*. Among men, chewing tobacco in the form of *paan masala*, *gutkha*, or other tobacco is also common.

Men are more likely to drink alcohol than to use tobacco. More than two in five men in Punjab drink alcohol (43%). Twenty-nine percent of men who drink, consume alcohol once a week or more frequently. A negligible proportion of women drink alcohol.

Source of health care

For most households, the private medical sector is the main source of health care (81% of urban households and 80% of rural households). Use of the public medical sector varies little and inconsistently with wealth. Among households that do not use government health facilities, the main reasons given for not doing so are poor quality of care (52%), lack of a nearby facility (42%), and long waiting times (23%) (data not shown in tables).

Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, only 7 percent of households in Punjab report that they have any kind of insurance that covers at least one member of the household. Two types of programmes dominate: the Employee State Insurance Scheme (ESIS) and the Central Government Health Scheme (CGHS). Health insurance is about three and a half times as common in urban areas as in rural areas and increases with household wealth. Nonetheless, even among households in the highest wealth quintile, only 12 percent have at least one usual member who has some form of health coverage.

WOMEN'S EMPOWERMENT

Employment and earnings

Twenty-three percent of currently married women in Punjab were employed in the last year, compared with 99 percent of currently married men. Seventy percent of employed women work in non-agricultural occupations. Twelve percent of employed women received no payment for their work, and 9 percent were paid only in kind. Overall, 79 percent of currently married employed women earn cash, compared with 99 percent of currently married employed men. Among married women who work and are paid in cash, 91 percent decide how their earnings will be spent, either alone or together with their husbands.

Decision making

Married women were asked who makes decisions on their own health care, making large household purchases, making household purchases for daily household needs, and visiting their own family or relatives. Only 37 percent of currently married women in Punjab participate in making all four of these decisions; 11 percent participate in none of the four decisions. Women more likely than most other women to participate in all four decisions are the oldest women (age 40-49), women who are employed for cash, and women in nuclear households.

Other indicators of women's empowerment

Only 27 percent of women have some money that they can decide how to use. The proportion of women with money which they control is highest among women who are currently widowed, divorced, separated, or deserted and women working for cash.

Only 15 percent of women have a bank or savings account that they themselves use, the same as the national average. Women's knowledge and use of microcredit programmes is very limited. More than two-fifths (41%) of women have heard of any microcredit programme in the area and only 1 percent have ever used one.

Two in five women in Punjab are allowed to go by themselves to the market, to a health facility, and to places outside their own community. Women are least likely to have freedom to travel outside their own village or community (44%) and most likely to be allowed to go to the market alone (53%). Widowed, divorced, or separated women, older women, and women employed for cash have more freedom of movement than most other women.

Gender-role attitudes

Half of women in Punjab—51 percent—believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to say that wife-beating is justified if a woman shows disrespect for her in-laws (38%), if she argues with her husband, or if he suspects she is unfaithful (30% each). Men in Punjab are less likely than women to agree with at least one of the justifications for wife-beating. Forty-one percent of men in Punjab justify wife-beating in some circumstances, including 31 percent who believe that disrespect for in-laws is a justification for wife-beating. Even among women and men who have completed at least 10 years of schooling, 32-35 percent agree that a husband is justified in beating his wife for one or more specified reasons.

More than seven in ten women and men (71-78%) in Punjab believe a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has sex with other women, or if she is tired or not in the mood.

DOMESTIC VIOLENCE

Among women age 15-49, 30 percent have ever experienced physical violence, and 6 percent have ever experienced sexual violence. In all, 31 percent of women in Punjab have experienced physical or sexual violence, including 33 percent of ever-married women.

Spousal violence

Twenty-three percent of ever-married women report having been slapped by their husbands; 8-13 percent report having their arms twisted or their hair pulled; being pushed, shaken, or having something thrown at them; being kicked, dragged, or beaten up; or being punched with the fist or with something that could hurt. One percent report that their husband tried to choke or burn them on purpose. Seven percent report that their husbands have physically

forced them to have sex and 3 percent report that they were forced by their husbands to perform sexual acts they did not want to perform. Eleven percent report spousal emotional violence. Overall, one in four ever-married women have experienced spousal physical or sexual violence from their current husband or, if currently not married, their most recent husband. Less than 1 percent of ever-married women in Punjab have ever initiated violence against their husband.

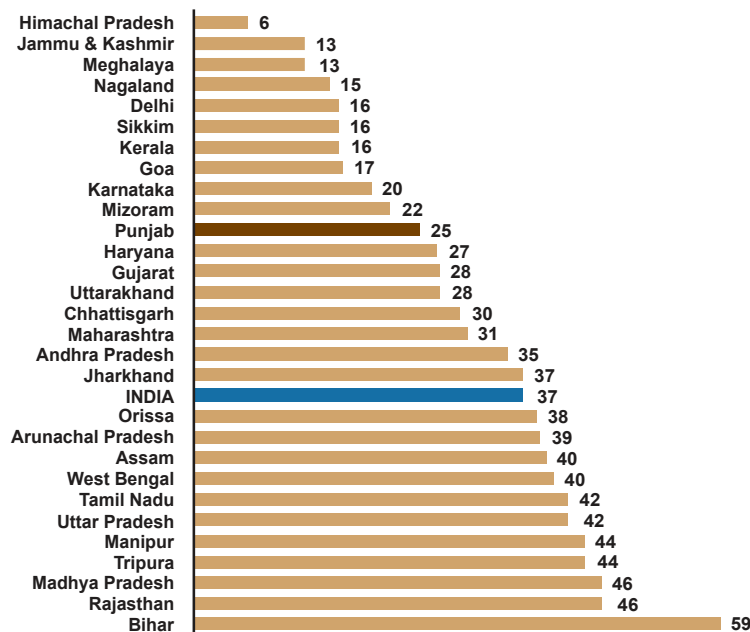

Prevalence of spousal violence declines sharply with education and wealth; however, about one in eight women who have at least 10 years of education and one in six women who belong to the highest wealth quintile has experienced spousal violence.

Women whose mothers were beaten by their fathers are almost three times as likely to be in abusive marriages themselves. Women whose husbands consume alcohol and get drunk often are three times more likely than women whose husbands do not consume any alcohol to experience spousal violence. Nonetheless, even among women whose husbands do not consume alcohol, about one-fifth have experienced spousal violence.

About half of women (49%) who have experienced spousal physical or sexual violence have suffered injuries as a result of the violence. For most women who have ever experienced spousal violence, the violence first occurred within the first three years of their marriage (data not shown in tables).

Spousal Physical or Sexual Violence by State

Percentage of ever-married women

One in four ever-married women in Punjab have experienced spousal violence – higher than in 10 other states.

Help seeking

Only 30 percent of women who have ever experienced violence have sought help to end the violence. Sixty-five percent of women have neither sought help nor told anyone about the violence. Abused women most often seek help from their own families. Very few women seek help from any institutional source such as the police or social service organizations.

Table 1 Results of the household and individual interviews

Number of households, number of interviews with women and men, and response rates, according to residence, Punjab, 2005-06

Result	Urban	Rural	Total
Household interviews			
Households selected	1,238	1,931	3,169

na = Not applicable

¹ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

² Total percentages may add to more than 100.0 because multiple answers are allowed.

³ Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly low-quality and partly high-quality materials are called *semi-pucca* houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

⁴ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes.

Table 4 Household possessions, ownership of agricultural land, and wealth index

Percentage of urban, rural, and total households and de jure population possessing various household goods, means of transport, agricultural land, a house, and farm animals and having a bank account, health insurance, a BPL card, and a mosquito net, and percent distribution by the wealth index, Punjab, 2005-06

Household possessions	Urban	Rural	Total	De jure population
Household goods

TFR 15-49	1.88	2.06	1.99	1.79	2.42	2.21	2.48	3.09	2.92
CBR	17.7	19.2	18.6	15.4	20.9	19.1	21.0	26.5	25.0

Note: Rates are for the period 1-36 months preceding the survey (approximately 1990-92 for NFHS-1, 1996-98 for NFHS-2, and 2003-05 for NFHS-3). Age-specific fertility rates are expressed per woman. Rates for the age group 45-49 might be slightly biased due to truncation.

TFR = Total fertility rate, expressed per woman

CBR = Crude birth rate, expressed per 1,000 population

() Based on 125-249 unweighted woman-years of exposure.

* Rate not shown, based on fewer than 125 unweighted woman-years of exposure.

Table 12 Fertility by background characteristics

Total fertility rates for the three years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility rates, by background characteristics, Punjab, 2005-06

Background characteristic	Total fertility rate	Percentage currently pregnant	Mean number of children ever born to women age 40-49 years	Total wanted fertility rate

Note: Women who have been sterilized or whose husband has been sterilized are considered to want no more children. Men who are sterilized or who mention in response to the question about desire for children that their wife has been sterilized are considered to want no more children. Total includes women and men belonging to the scheduled tribes and those with missing information on caste/tribe, who are not shown separately.

na = Not applicable

nc = Not calculated because there are no cases

() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

¹ Includes current pregnancy of woman/wife.

² Includes women and men with no children, who are not shown separately.

³ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

⁴ Excludes pregnant women and men with pregnant wives.

Table 18 Ideal number of children

Percent distribution of women and men age 15-49 by ideal number of children, and mean ideal number of children, by number of living children, Punjab, 2005-06, and percent distribution of ever-married women and men age 15-49 by ideal number of children, NFHS-3, NFHS-2, and NFHS-1

Number of users	852	32	76	147	5	409	1,523

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status.

CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; NGO = Nongovernmental organization

() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

Table 25 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the five years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, and the percentage who were informed about other methods they could use, by method and initial source of method, Punjab, 2005-06

Method/source	Percentage who were informed about side effects or problems of method used	Percentage who were informed about what to do if experienced side effects	Percentage who were informed by a health or family planning worker about other methods that could be used	Number of women
Method				
Female sterilization ¹	34.8	27.3	26.7	182
Pill	31.4	23.5	33.5	51
IUD	42.7	36.5	39.5	98
Initial source of method²				
Public medical sector	38.6	30.3	30.4	216
Private medical sector	34.2	28.7	34.1	112
Total	36.6	29.4	31.5	332

Note: Table includes only the contraceptive methods separately shown and excludes users who obtained their method from friends/relatives. Total includes women who reported the initial source of the method as a nongovernmental organization or other sources, who are not shown separately.

¹ Among women who were sterilized in the five years preceding the survey.

² Source at start of current episode of use.

Table 26 First-year contraceptive discontinuation rates

Percentage of contraceptive users who discontinued use of a method within 12 months after beginning its use, by reason for discontinuation and percentage who switched to another method, by type of method, Punjab, 2005-06

Method	Method failure	Desire to become pregnant	Side effects/health concerns	Infrequent sex/ husband away	Marital dissolution/ separation	Other reason	Total	Switched to another method ¹
Female sterilization	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
IUD	0.7	0.7	8.5	0.0	0.7	4.7	15.2	8.2
Condom/Nirodh	3.0	11.4	1.5	2.0	0.0	7.6	25.5	4.4
All modern spacing methods ²	2.8	7.6	5.4	1.7	0.2	7.1	24.8	6.5
All spacing methods ³	3.2	9.3	4.2	1.8	0.1	5.9	24.5	5.4
All methods	2.5	7.4	3.4	1.5	0.1	4.7	19.5	4.3

Note: Table is based on episodes of contraceptive use that began 3-59 months prior to the survey.

¹ Used a different method in the month following discontinuation or said they wanted a more effective method and started another method within two months of discontinuation.

² Includes other modern spacing methods that are not shown separately.

³ Includes other spacing methods that are not shown separately.

Table 27 Men's contraception-related perceptions and knowledge

Percentage of men age 15-49 who agree with two specific statements about women and contraception and say that a woman who is breastfeeding cannot become pregnant, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Punjab, 2005-06

Background characteristic	Percentage of men who agree			Percentage of men who say that if a male condom is used correctly, it protects against pregnancy:				Total	Number of men
	Contraception is women's business and a man should not have to worry about it	Women who use contraception may become promiscuous	A woman who is breastfeeding cannot become pregnant	Most of the time	Some-times	Not at all	Don't know/unsure ¹

Total	2.6	4.7	7.3	4.7	58.5	63.3	7.3	63.2	70.6	89.6	2,634

Note: Total includes women belonging to the scheduled tribes and women with missing information on caste/tribe, who are not shown separately.

() Based on 25-49 unweighted cases.

¹ Unmet need for spacing includes pregnant women whose pregnancy was mistimed; amenorrhoeic women who are not using family planning and whose last birth was mistimed, or whose last birth was unwanted but now say they want more children; and fecund women who are neither pregnant nor amenorrhoeic, who are not using any method of family planning, and say they want to wait 2 or more years for their next birth. Also included in unmet need for spacing are fecund women who are not using any method of family planning and say they are unsure whether they want another child or who want another child but are unsure when to have the birth.

Unmet need for limiting refers to pregnant women whose pregnancy was unwanted; amenorrhoeic women who are not using family planning, whose last child was unwanted, and who do not want any more children; and fecund women who are neither pregnant nor amenorrhoeic, who are not using any method of family planning, and who want no more children. Excluded from the unmet need category are pregnant and amenorrhoeic women who became pregnant while using a method (these women are in need of a better method of contraception).

² Using for spacing is defined as women who are using some method of family planning and say they want to have another child or are undecided whether to have another. Using for limiting is defined as women who are using and who want no more children. Note that the specific methods used are not taken into account here.

³ Nonusers who are pregnant or amenorrhoeic whose pregnancy was the result of a contraceptive failure are not included in the category of unmet need, but are included in total demand for contraception (since they would have been using had their method not failed).

⁴ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

Table 29 Age at first marriage

Percentage of women and men age 15-49 who were first married by specific exact ages, percentage never married, and median age at first marriage, first cohabitation with spouse, and first sex according to current age, Punjab, 2005-06

na = Not applicable

() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

¹ Doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, or other health personnel.

² Based on the last live birth in the five years preceding the survey.

³ Postnatal check-ups are checks on the woman's health within 42 days of the birth.

⁴ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

Table 39 Trends in maternal care indicators

Maternal care indicators for births during the three years preceding the survey, by residence, NFHS-3, NFHS-2, and NFHS-1, Punjab

Indicator	NFHS-3	NFHS-2	NFHS-1
URBAN			
Percentage who received antenatal care ¹	92.8	91.4	91.9
Percentage who had at least three antenatal care visits ¹	77.6	85.3	72.3
Percentage who received antenatal care within the first trimester of pregnancy ¹	66.4	70.1	40.4
Percentage of births delivered in a health facility ²	60.2	56.0	35.4
Percentage of deliveries assisted by health personnel ^{2, 3}	70.7	77.8	59.9
RURAL			
Percentage who received antenatal care ¹	89.4	69.2	86.2
Percentage who had at least three antenatal care visits ¹	70.2	49.9	58.9
Percentage who received antenatal care within the first trimester of pregnancy ¹	55.2	36.5	23.4
Percentage of births delivered in a health facility ²	48.4	31.9	21.6
Percentage of deliveries assisted by health personnel ^{2, 3}	67.4	58.0	45.4
TOTAL			
Percentage who received antenatal care ¹	90.6	74.5	87.6
Percentage who had at least three antenatal care visits ¹	72.8	58.4	62.2
Percentage who received antenatal care within the first trimester of pregnancy ¹	59.2	44.6	27.5
Percentage of births delivered in a health facility ²	52.5	37.5	24.9
Percentage of deliveries assisted by health personnel ^{2, 3}	68.6	62.6	48.8

¹ Based on the last birth to ever-married women in the three years preceding the survey.

² Based on the last two births to ever-married women in the three years preceding the survey.

³ Doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, or other health personnel.

Table 40 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present during at least one antenatal care visit, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Punjab, 2005-06

Antenatal/delivery care and information	Urban	Rural	Total
Percentage of men for whom the youngest child's mother received antenatal care	88.9	75.2	81.3
Percentage of men who were present at any antenatal care visit	68.9	48.7	57.6
Percentage who were told by a health provider or health worker about the following signs of pregnancy complications:			
Vaginal bleeding	37.8	29.2	33.0
Convulsion	34.4	27.4	30.5
Prolonged labour	37.8	33.6	35.5
Percentage ever told what to do if mother had any pregnancy complication	55.6	49.6	52.2
Percentage whose youngest child was delivered in a health facility	62.2	42.5	51.2
Percentage to whom a health provider or worker spoke about the following aspects of maternal care:			
The importance of delivering in a health facility	70.0	58.4	63.6
The importance of proper nutrition for the mother during pregnancy	72.2	61.1	66.0
Family planning or delaying his next child	65.6	54.0	59.1
Number of men with a child age 0-35 months	90	113	203
Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of:			
Breastfeeding the baby immediately after birth	(64.7)	67.7	66.7
Keeping the baby warm immediately after birth	(67.6)	69.2	68.7
Cleanliness at the time of delivery	(64.7)	67.7	66.7
Using a new or unused blade to cut the cord	(61.8)	63.1	62.6
Number of men whose last child age 0-35 months was not delivered in a health facility	34	65	99

() Based on 25-49 unweighted cases.

Table 41 Vaccinations by background characteristics

Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), and percentage with a vaccination card seen by the interviewer, by background characteristics, Punjab, 2005-06 and totals for NFHS-2 and NFHS-1

ORT = Oral rehydration therapy, which includes solution prepared from an oral rehydration salt packet and gruel

() Based on 25-49 unweighted cases.

* Percentage not shown; based on 25-49 unweighted cases.

¹ Equivalent to the UNICEF/WHO indicator 'Home management of diarrhoea'.

² Continued feeding includes children who were given more, same as usual, or somewhat less food during the diarrhoea episode.

³ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

Table 45 Knowledge of ORS packets

Percentage of all women and percentage of women who had a live birth in the five years preceding the survey who know about ORS packets for treatment of diarrhoea, by background characteristics, Punjab, 2005-06

ICDS = Integrated Child Development Services

na = Not applicable

nc = Not calculated because there are no cases

() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

¹ AWC services for children include distribution of supplementary food, growth monitoring, immunizations, health check-ups, and preschool education.

² Supplementary food includes both food cooked and served at the AWC on a daily basis and food given in the form of take home rations.

³ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

Table 47 Utilization of ICDS services during pregnancy and while breastfeeding

Among children under age six years in areas covered by an *anganwadi* centre (AWC), percentage whose mothers received specific services from an AWC during pregnancy and while breastfeeding, according to background characteristics, Punjab, 2005-06

Background characteristic	Mother received from an AWC during pregnancy					Mother received from an AWC while breastfeeding ²

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation units (SD) from the median of the 2006 WHO International Reference Population. Table is based on children with valid dates of birth (month and year) and valid measurements of both height and weight. Total includes children with missing information on size at birth, mother's nutritional status, and caste/tribe, and children belonging to the scheduled tribes, who are not shown separately.

BMI = Body mass index (kg/m²)

() Based on 25-49 unweighted cases.

* Not shown; based on fewer than 25 unweighted cases.

¹ Includes children who are below -3 standard deviations (SD) from the International Reference Population median.

² Excludes children whose mothers were not interviewed.

³ First born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval.

⁴ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

⁵ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

⁶ Includes children whose mothers are deceased.

Table 49 Initial breastfeeding

Percentage of children born in the five years preceding the survey who were ever breastfed, and for last-born children born in the five years preceding the survey who were ever breastfed, percentage who started breastfeeding within half an hour, one hour, and one day of birth and percentage who received a prelacteal feed, by background characteristics, Punjab, 2005-06

Background characteristic	Percentage ever breastfed	Number of children	Percentage who started breastfeeding:			Percentage who received a prelacteal feed ³	Number of last-born ever breastfed children
			Within half an hour of birth	Within one hour of birth ¹	Within one day of birth ²

Note: Table is based on children born in the last five years whether the children are living or dead at the time of interview. Total includes children with missing information on caste/tribe, who are not shown separately.

TBA = Traditional birth attendant

() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

¹ Includes children who started breastfeeding within half an hour of birth.

² Includes children who started breastfeeding within one hour of birth.

³ Children given something other than breast milk during the first three days of life.

⁴ Doctor, nurse, midwife, auxiliary nurse midwife, lady health visitor, or other health personnel.

⁵ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

Table 50 Breastfeeding status by age

Percent distribution of youngest children under three years living with the mother by breastfeeding status and percentage of all children under three years using a bottle with a nipple, according to age in months, Punjab, 2005-06

Age in months	Breastfeeding and consuming:						Total	Number of youngest children under three years	Percentage using a bottle with a nipple ¹	Number of children
	Not breast-feeding	Exclusively breastfed	Plain water only	Non-milk liquids/juice	Other milk	Complementary foods				
<2	(0.0)	(54.7)	(5.6)	(2.8)	(28.3)	(8.6)	100.0	35	(10.9)	36
2-3	8.6	31.8	20.7	10.6	26.7	1.7	100.0	57	20.6	58
4-5	(2.6)	(24.9)	(20.0)	(4.9)	(32.8)	(14.8)	100.0	40	(29.9)	41
6-8	8.3	4.8	13.1	5.0	17.9	50.9	100.0	61	34.5	61
9-11	(24.7)	(0.0)	(7.1)	(2.4)	(7.4)	(58.4)	100.0	41	(59.0)	41
12-17	21.3	0.8	4.7	1.5	3.1	68.6	100.0	127	36.6	131
18-23	31.6	0.0	1.1	2.1	4.2	61.0	100.0	93	34.3	108
24-35	62.5	0.0	1.2	0.6	0.0	35.7	100.0	167	30.5	247
<4	5.3	40.5	15.0	7.7	27.3	4.3	100.0	92	16.9	94
<6	4.5	35.7	16.5	6.8	29.0	7.5	100.0	132	20.9	135
6-9	8.6	4.2	14.0	4.3	18.2	50.7	100.0	71	38.3	71
12-23	25.6	0.5	3.1	1.8	3.6	65.4	100.0	220	35.6	239

Note: Breastfeeding status refers to a '24-hour' period (yesterday and last night). Children who are classified as *breastfeeding and consuming plain water only* consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water only, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus any children who get complementary food are classified in that category as long as they are breastfeeding as well. Children who receive breast milk and non-milk liquids and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water.

() Based on 25-49 unweighted cases.

¹ Based on all children under three years.

Table 51 Median duration of breastfeeding and infant and young child feeding (IYCF) practices

Background characteristic	Median duration (months) of breastfeeding among last-born children born in the last three years ¹				Among breastfed children 6-23 months, percentage fed: 3+ food groups and minimum number of times ⁴				Among all children 6-23 months, percentage fed:

Note: Total includes children with missing information on caste/tribe, who are not shown separately.

na = Not applicable

() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

¹ It is assumed that children not currently living with the mother are not currently breastfeeding.

² Either exclusively breastfed or received breast milk and plain water and/or non-milk liquids only.

³ Food groups are: a. infant formula, milk other than breast milk, cheese or yogurt or other milk products; b. foods made from grains or roots, including porridge or gruel, fortified baby food; c. vitamin A-rich fruits and vegetables; d. other fruits and vegetables; e. eggs; f. meat, poultry, fish, shellfish, or organ meats; g. beans, peas, lentils, or nuts; h. foods made with oil, fat, ghee, or butter.

⁴ At least twice a day for breastfed infants 6-8 months and at least three times a day for breastfed children 9-23 months.

⁵ Commercially produced infant formula; tinned, powdered, or fresh animal milk; cheese; yogurt; or other milk products.

⁶ Three or more food groups for breastfed children and four or more food groups for non-breastfed children.

⁷ Fed solid or semi-solid food at least twice a day for infants 6-8 months, 3 or more times for other breastfed children, and 4 or more times for non-breastfed children.

⁸ Non-breastfed children age 6-23 months are considered to be fed with three IYCF practices if they receive milk or milk products and are fed at least the minimum number of times per day with at least the minimum number of food groups.

⁹ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

Table 52 Prevalence of anaemia in children

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Punjab, 2005-06, and percentage of children age 6-35 months classified as having anaemia, NFHS-3 and NFHS-2

Background characteristic	Anaemia status by haemoglobin level			Any anaemia (<11.0 g/dl)	Number of children
	Mild (10.0-10.9 g/dl)	Moderate (7.0-9.9 g/dl)	Severe (<7.0 g/dl)

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Total includes children belonging to the scheduled tribes and children with missing information on mother's anaemia status and caste/tribe, who are not shown separately.

() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

¹ Excludes children whose mothers were not interviewed.

² For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

³ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

⁴ Includes children whose mothers are deceased.

Table 5.3. Micronutrient intake among children

Percentage of youngest children age 6-35 months living with their mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children age 12-35 months and 6-59 months who were given vitamin A supplements in the six months preceding the survey, percentage of children age 6-59 months who were given iron supplements in the past seven days, who were given deworming medication in the six months preceding the survey, and who live in households using adequately iodized salt, by background characteristics, Punjab, 2005-06

Background characteristic	Youngest children age 6-35 months living with their mother			Children age 12-35 months			Children age 6-59 months			Children age 6-59 months in households with salt tested	
	Percentage who consumed vitamin A in last 24 hours ¹	Percentage who consumed iron rich in foods ²	Number of children	Percentage given vitamin A supplements in last 6 months	Number of children	Percentage given iron supplements in last 7 days	Percentage given deworming medication in last 6 months ³	Percentage living in households using adequately iodized salt ⁴	Number of children	Percentage living in households using adequately iodized salt ⁴	Number of children

na = Not applicable

() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

¹ Sexual intercourse with a partner who was neither a spouse nor who lived with the respondent.

² Injections given by a doctor, nurse, pharmacist, dentist, or other health worker.

Table 61 Knowledge of AIDS and sexual behaviour: Youth

Indicators of HIV/AIDS knowledge and sexual behaviour for women and men age 15-24, by residence, Punjab, 2005-06

Knowledge and behaviour	Urban		Rural		Total	
	Women	Men	Women	Men	Women	Men
Knowledge						
Percentage with comprehensive knowledge of AIDS ¹	28.3	33.8	28.8	39.9	28.6	37.1
Percentage who know a condom source	52.4	85.1	44.8	87.8	47.5	86.6
Sexual behaviour						
Percentage who have ever had sexual intercourse	36.7	27.0	37.7	31.4	37.4	29.4
Percentage who had sexual intercourse before age 15	3.4	3.2	2.2	2.6	2.6	2.8
HIV testing, injections, and blood transfusion						
Percentage who have ever had a blood transfusion	3.4	0.9	2.5	0.4	2.9	0.6
Percentage who received an injection from a health worker in the past 12 months ²	28.3	37.8	37.8	53.9	34.5	46.6
Mean number of medical injections in the past 12 months ²	1.2	1.5	2.1	2.3	1.8	1.9
Number of respondents age 15-24	485	222	884	271	1,369	493
Among those who received an injection from a health worker in the past 12 months, percentage for whom for the last injection, the syringe and needle were taken from a newly opened package or the needle was sterilized ²	94.7	95.2	95.0	93.2	94.9	93.9
Number of respondents who received an injection from a health worker in the past 12 months ²	137	84	334	146	472	230
Percentage who used a condom at first sexual intercourse	4.7	28.3	3.8	23.5	4.1	25.5
Number who ever had sexual intercourse	178	60	333	85	511	145
Percentage tested for HIV and received results in the past 12 months	1.8	(2.2)	1.2	2.7	1.4	2.5
Percentage who had higher-risk intercourse ³ in the past 12 months	0.6	(41.3)	1.5	48.0	1.2	45.5
Number who had sexual intercourse in the past 12 months	172	46	326	75	497	121
Percentage who reported using a condom at last higher-risk intercourse ³	*	*	*	(44.4)	*	49.1
Number who had higher-risk sexual intercourse ³ in the past 12 months	1	19	5	36	6	55
Among those never married						
Percentage who have never had sexual intercourse	99.3	83.9	99.3	81.9	99.3	82.9
Percentage who had sexual intercourse in the past 12 months	0.3	9.3	0.7	13.7	0.6	11.7
Number of never married respondents age 15-24	309	193	555	227	863	420

() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

¹ Respondents with comprehensive knowledge say that use of a condom for every act of sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV/AIDS, say that a healthy-looking person can have HIV/AIDS, and reject the two most common misconceptions in NFHS-3, namely that HIV/AIDS can be transmitted by mosquito bites and by sharing food.² Injection given by a doctor, nurse, pharmacist, dentist, or other health worker.³ Sexual intercourse with a partner who was neither a spouse nor lived with the respondent.

Table 62. Attitudes toward family life education in school

Percentage of women and men age 15-49 who agree that specific topics on family life education should be taught in school to girls and to boys, and percent distribution of those who agree that a specific topic should be taught in school by the age at which they believe that the topic should first be taught in school, Punjab, 2005-06

Topics	Percentage who say that the topic should be taught in school to girls				Percentage who say that the topic should be taught in school to boys				Number who say that topic should be taught in school to boys									
	Number of respondents	Age topic should be first taught in school to girls			Number of respondents	Age topic should be first taught in school to boys				Total								
		<10 years	10-12 years	13-15 years		16 years or older	Don't know/missing	<10 years			10-12 years	13-15 years	16 years or older	Don't know/missing

Note: Total includes women belonging to the scheduled tribes and those with missing information on caste/tribe, who are not shown separately.

¹ To the market, to the health facility, and to places outside the village/community.

² Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

³ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

Table 73 Gender-role attitudes

Percentage of women and men age 15-49 with specific attitudes toward wife beating and refusal by a wife to have sex with her husband by reason and percentage of men age 15-49 who agree that a man can behave in specific ways if his wife refuses him sex, according to marital status, Punjab, 2005-06

Reason/behaviour	Ever married		Never married		Total	
	Women	Men	Women	Men	Women	Men
Percentage who agree that a husband is justified in hitting or beating his wife if:						
She goes out without telling him	28.4	20.8	16.3	22.4	25.4	21.4
She neglects the house or children	30.4	15.0	22.0	21.4	28.3	17.6
She argues with him	32.0	20.1	21.9	25.3	29.5	22.2
She refuses to have sexual intercourse with him	17.5	7.6	8.1	10.8	15.1	8.9
She doesn't cook food properly	21.2	9.5	15.1	13.6	19.7	11.1
He suspects she is unfaithful	33.1	22.1	19.1	25.9	29.6	23.7
She shows disrespect for in-laws	40.5	27.6	29.3	35.5	37.7	30.8
Percentage who agree with at least one specified reason	55.0	36.9	40.2	47.5	51.3	41.1
Percentage who agree that a wife is justified in refusing to have sex with her husband when she:						
Knows husband has a sexually transmitted disease	87.4	95.3	77.9	86.0	85.0	91.6
Knows husband has sex with other women	87.0	90.9	80.9	79.4	85.4	86.3
Is tired or not in the mood	79.9	89.3	71.8	82.4	77.8	86.5
Percentage who agree with all three reasons	73.1	84.0	65.7	70.1	71.2	78.4
Percentage who agree with none of the three reasons	6.3	2.4	14.1	7.6	8.3	4.5
Percentage who agree that when a woman refuses to have sex with her husband, he has the right to:						
Get angry and reprimand her	na	20.1	na	23.4	na	21.4
Refuse to give her financial support	na	7.2	na	7.6	na	7.4
Use force to have sex	na	7.8	na	10.6	na	8.9
Have sex with another woman	na	6.0	na	7.4	na	6.6
Percentage who agree with all four behaviours	na	3.4	na	2.8	na	3.1
Percentage who agree with none of the four behaviours	na	76.9	na	69.9	na	74.1
Number of respondents	2,757	746	924	501	3,681	1,247

na = Not applicable

Table 74 Gender-role attitudes by background characteristics

Percentage of women and men age 15-49 who agree that a husband is justified in hitting or beating his wife for at least one specified reason and who agree that a wife is justified in refusing to have sex with her husband for all specified reasons, and percentage of men who agree that when a wife refuses to have sex with her husband, the husband does not have the right to any of the four specified behaviours, by background characteristics, Punjab, 2005-06

Background characteristic	Percentage who agree that a husband is justified in hitting or beating his wife for at least one specified reason ¹		Percentage who agree that a wife is justified in refusing to have sex with her husband for all specified reasons ²		Percentage who agree that when a wife refuses to have sex with her husband, he does not have the right to any of the four specified behaviours ³	Number

Note: Total includes women/men with missing information on employment (past 12 months) and on caste/tribe and those belonging to the scheduled tribes, who are not shown separately.

() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

¹ Specified reasons are: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook food properly, he suspects she is unfaithful, and she shows disrespect for in-laws.

² Specified reasons are: she knows husband has a sexually transmitted disease, knows husband has sex with other women, and is tired or not in the mood.

³ Specified behaviours are: get angry and reprimand her, refuse to give her financial support, use force to have sex, and have sex with another woman.

⁴ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

⁵ Not belonging to scheduled castes, scheduled tribes, or other backward classes.

Table 75 Experience of physical or sexual violence

Percentage of women age 15-49 who have ever experienced physical or sexual violence, and among those who have experienced physical or sexual violence, the person committing the violence, by marital status, Punjab, 2005-06

Type of violence/perpetrator	Ever married	Never married	Total
Type of violence experienced			
Physical violence ever	31.7	24.2	29.9
Sexual violence ever	7.4	1.3	5.9
Physical and sexual violence ever	6.3	0.3	4.9
Physical or sexual violence ever	32.7	25.2	30.9
Number of women	1,742	569	2,311
Person committing physical violence			
Current husband	71.2	0.0	57.0
Former husband	5.9	0.0	4.7
Father/step-father	16.1	31.2	19.1
Mother/step-mother	33.5	56.6	38.1
Sister/brother	17.5	24.8	19.0
Daughter/son	0.1	0.0	0.1
Other relative	1.0	0.0	0.8
Mother-in-law	0.6	0.0	0.5
Father-in-law	0.1	0.0	0.1
Other in-law	0.3	0.0	0.3
Teacher	12.4	57.0	21.3
Number who experienced physical violence	553	138	690
Person committing sexual violence			
Current husband	85.2	*	80.3
Former husband	9.9	*	9.3
Current/former boyfriend	0.0	*	0.9
Other relative	1.0	*	3.3
Own friend/acquaintance	3.5	*	5.6
Teacher	0.5	*	0.5
Number who experienced sexual violence	128	8	136

Note: All women were asked about their experience of physical violence since age 15. Ever-married women were also asked about their experience of spousal physical violence at any age.
* Percentage not shown; based on fewer than 25 unweighted cases.

Table 76 Forms of spousal violence

Percentage of ever-married women age 15-49 who have experienced various forms of violence committed by their husband ever or in the 12 months preceding the survey, Punjab, 2005-06

Type of violence	Ever	In the past 12 months ¹		
		Often	Sometimes	Often or sometimes
Physical violence				
Any form of physical violence	24.4	3.2	14.1	17.4
Pushed her, shook her, or threw something at her	10.8	1.3	5.2	6.4
Slapped her	23.1	2.8	13.1	15.9
Twisted her arm or pulled her hair	12.7	1.8	6.4	8.3
Punched her with his fist or with something that could hurt her	8.2	1.2	3.8	5.0
Kicked her, dragged her, or beat her up	7.5	0.9	3.6	4.6
Tried to choke her or burn her on purpose	1.3	0.2	0.6	0.8
Threatened her or attacked her with a knife, gun, or any other weapon	0.4	0.3	0.1	0.4
Sexual violence				
Any form of sexual violence	7.2	1.9	4.0	5.8
Physically forced her to have sexual intercourse with him even when she did not want to	7.0	1.8	3.8	5.5
Forced her to perform any sexual acts she did not want to	3.0	0.3	1.9	2.2
Emotional violence				
Any form of emotional violence	10.7	1.8	6.1	7.9
Said or did something to humiliate her in front of others	8.3	1.1	5.0	6.0
Threatened to hurt or harm her or someone close to her	3.6	0.6	1.2	1.8
Insulted her or made her feel bad about herself	7.6	1.2	4.0	5.3
Any form of physical and/or sexual violence	25.4	4.3	14.2	18.5
Any form of physical and sexual violence	6.2	2.6	3.1	5.6
Any form of physical and/or sexual and/or emotional violence	26.7	5.0	14.9	20.0
Any form of physical and sexual and emotional violence	3.4	1.4	1.6	3.0
Any violence by women against their husband ²	0.4	0.0	0.3	0.3
Number of ever-married women	1,742	1,679	1,679	1,679

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

¹ Excludes widows.

² Any violence by women against their husband when he was not already beating or physically hurting them.

Table 77 Spousal violence by background characteristics

Percentage of ever-married women age 15-49 by whether they have ever experienced emotional, physical, or sexual violence committed by their husband, according to background characteristics, Punjab, 2005-06

* Percentage not shown; based on fewer than 25 unweighted cases.

APPENDIX

ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) nonsampling errors and (2) sampling errors. Nonsampling errors are the result of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the third National Family Health Survey (NFHS-3) to minimize this type of error, nonsampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-3 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the *standard error* for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-3 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-3 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, $r = y/x$, where y represents the total sample value for variable y , and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^2(r) = var(r) = \frac{1-f}{x^2} \sum_{h=1}^H \left[\frac{m_h}{m_h - 1} \left(\sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}, \text{ and } z_h = y_h - rx_h$$

where h represents the stratum, which varies from 1 to H ,
 m_h is the total number of clusters selected in the h^{th} stratum,
 y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} stratum,
 x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum,
and
 f is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers *all but one* cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-3 sample for Punjab, there were 99 clusters. Hence, 99 replications were created. The variance of a rate r is calculated as follows:

$$SE^2(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^k (r_i - r)^2$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where r is the estimate computed from the full sample of 99 clusters,
 $r_{(i)}$ is the estimate computed from the reduced sample of 98 clusters (i^{th} cluster excluded), and
 k is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits ($R \pm 2SE$) for each estimate are also computed.

Sampling errors for NFHS-3 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Punjab as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A.2 presents the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ($R \pm 2SE$) for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1). In the case of the total fertility rate, the number of unweighted cases is not relevant, as there is no known unweighted value for woman-years of exposure to childbearing.

Table A.1 List of variables for sampling errors, Punjab, 2005-06

Variable	Estimate	Base population
Sex ratio (females per 1,000 males)	Ratio	De facto household population, all ages
No education	Proportion	De facto household population of females/males age 6 and above
Tuberculosis prevalence	Rate	100,000 usual household residents
Using adequately iodized salt	Proportion	Households
Urban residence	Proportion	Women/men age 15-49
No education	Proportion	Women/men age 15-49
Completed 10 or more years of education	Proportion	Women/men age 15-49
Never married, including married <i>gauna</i> not performed	Proportion	Women/men age 15-49
Currently married	Proportion	Women/men age 15-49
Married before age 18	Proportion	Women age 20-49
Married before age 21	Proportion	Men age 25-49
Currently using any method	Proportion	Currently married women age 15-49
Currently using a modern method	Proportion	Currently married women age 15-49
Currently using a traditional method	Proportion	Currently married women age 15-49
Currently using female sterilization	Proportion	Currently married women age 15-49
Currently using pill	Proportion	Currently married women age 15-49
Currently using IUD	Proportion	Currently married women age 15-49
Currently using condom	Proportion	Currently married women age 15-49
Using public medical sector source of contraception	Proportion	Women age 15-49 currently using modern methods of contraception
Want no more children	Proportion	Currently married women/men age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married women/men age 15-49
Ideal number of children	Mean	Women/men age 15-49
Mother received ANC from health personnel	Proportion	Women with at least one birth in last five years (last birth)
Took iron and folic acid (IFA) for 90 days or more	Proportion	Women with at least one birth in last five years (last birth)
Births delivered by a skilled provider	Proportion	Births in last 5 years
Institutional delivery	Proportion	Births in last 5 years
Postnatal check for mother within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Treated with ORS packets	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Children with diarrhoea taken to a health provider	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Child's vaccination card seen by interviewer	Proportion	Children age 12-23 months
Child received BCG vaccination	Proportion	Children age 12-23 months
Child received DPT vaccination (3 doses)	Proportion	Children age 12-23 months
Child received polio vaccination (3 doses)	Proportion	Children age 12-23 months
Child received measles vaccination	Proportion	Children age 12-23 months
Child fully vaccinated	Proportion	Children age 12-23 months
Children given vitamin A supplement in last 6 months	Proportion	Children age 6-59 months
Ever experienced physical or sexual violence	Proportion	Women age 15-49
Weight-for-height, wasting (below -2SD)	Proportion	Children under age 5 years who were measured
Height-for-age, stunting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-age, underweight (below -2SD)	Proportion	Children under age 5 years who were measured
Body mass index (BMI) <18.5 kg/m ²	Proportion	Women/men age 15-49 who were measured
Body mass index (BMI) ≥25.0 kg/m ²	Proportion	Women/men age 15-49 who were measured
Have heard of AIDS	Proportion	Women/men age 15-49
Have comprehensive knowledge about HIV/AIDS	Proportion	Women/men age 15-49
Total and age-specific fertility rates (last 3 years)	Rate	Woman years of exposure
Mortality rates	Rate	Births in last 5 years
Women/men with any anaemia	Proportion	Women/men age 15-49
Children with any anaemia	Proportion	Children age 6-59 months
