Man's Questionnaire	135
PSU Information Forms.....	167

Chapter 1, Section 1.7, in Volume I of this report contains basic information about the sample design and sample implementation for the 2005-06 National Family Health Survey (NFHS-3). This appendix contains additional details about the sampling, including the methodology for determining the sample size, the sampling frame, sample selection in rural and urban areas, stratification of the sample, the selection of households, and sample weights.

Sample Size

The determination of the overall sample size for NFHS-3 was governed by several considerations, including the magnitude of the key indicators, the subgroups for which the indicators are required, the desired level of precision of the estimates, the availability of resources, and logistical considerations. Besides the requirement of producing population and health indicators at both the national and state levels, two additional considerations were critical for determining the size of the sample for NFHS-3. The survey was tasked with producing a) HIV prevalence estimates at the national level and at the state level for each of the six states identified by the National AIDS Control Organization (NACO) as having high HIV prevalence (Andhra Pradesh, Karnataka, Maharashtra, Manipur, Nagaland, and Tamil Nadu), and Uttar Pradesh, and b) robust estimates of population and health indicators for slum areas and for non-slum areas in eight cities, namely Delhi, Chennai in Tamil Nadu, Hyderabad in Andhra Pradesh, Indore in Madhya Pradesh, Kolkata in West Bengal, Meerut in Uttar Pradesh, and Mumbai and Nagpur in Maharashtra. Both of these requirements were crucial for determining the target number of individual interviews. In light of these requirements, the sample size was estimated separately for the number of individual interviews with women and with men and the number of women and number of men to be tested for HIV.

Sample size for HIV tests

The expected level of HIV prevalence, the acceptable level of standard errors for HIV prevalence, and the design effect of the sample design were the three prime determinants of sample size for HIV tests at the national level and at the state level for each of the seven states for which separate HIV estimates were to be produced. To estimate the required sample size for HIV testing, it was necessary to make a reasonable assumption about the design effect of HIV prevalence for the NFHS-3 sample design. The design effect is defined as the ratio of the standard error of the HIV estimate for the NFHS-3 sample design to the standard error that would result if a simple random sample had been used. Based on the experience of testing HIV in national household surveys in other countries, a design effect of 1.25 was assumed. The actual design effect of HIV prevalence in NFHS-3 (1.19 for women and 1.33 for men) was very close to the assumed design effect of 1.25.

In the absence of any previous community-based estimate of HIV prevalence for India, the HIV prevalence rates as reported by NACO of 0.92 percent at the national level, 0.75 percent

for Tamil Nadu, and 1.25 percent for each of the remaining five high HIV prevalence states were used for estimation of the sample size for the number of HIV tests. For state-level estimates of HIV prevalence, the maximum permissible relative standard error for women and men together was set at 15 percent. However, for the national estimate, the maximum permissible relative standard error was set at a low level of 5 percent. The table below gives the assumptions at the national and state levels, the proposed sample sizes of women and men to be tested compatible with the assumptions, and the expected precision of the HIV prevalence estimate associated with the proposed sample sizes for India as a whole and for each of the six high HIV prevalence states.

Region	Assumed HIV prevalence rate	Assumed design effect	Proposed sample size	Estimated relative precision of resulting HIV prevalence estimate	Confidence interval	
					Lower bound	Upper bound
Tamil Nadu						
Women and men separately	0.75	1.25	6,400	18.0%	0.5%	1.0%
Women and men together	0.75	1.25	12,800	12.7%	0.6%	0.9%
Each of the remaining five high HIV prevalence states						
Women and men separately	1.25%	1.25	6,400	13.9%	0.9%	1.6%
Women and men together	1.25%	1.25	12,800	9.8%	1.0%	1.5%
India						
Women and men separately	0.92%	1.25	62,693	5.2%	0.8%	1.0%
Women and men together	0.92%	1.25	125,385	3.7%	0.9%	1.0%

Based on the assumed levels of HIV prevalence, the maximum permissible level of the relative standard errors and the design effects, it was determined that in each of the six high HIV prevalence states, 6,400 women and 6,400 men would be tested for HIV, and at the national level, the number tested would be about 125,000 women and men in about equal numbers. This sample size was sufficiently large to permit national estimates for urban and rural areas and for youth age 15-24 with a somewhat lower, but still acceptable, level of precision.

It was thus originally planned to have a total of about 76,800 persons tested in the six high HIV prevalence states. The balance of HIV tests needed to achieve a national sample of 125,385 HIV tests were to be distributed to all the remaining states in proportion to the sample size for individual interviews of women and men in those states. However, after the planning process had begun, it was decided to conduct 24,400 HIV tests in Uttar Pradesh in order to provide a separate estimate of HIV prevalence for this state. In light of this change, the final HIV sample design increased the required number of HIV tests nationally to 134,000, with approximately 101,000 tests in the seven states for which separate estimates were to be provided and 33,000 tests distributed between the remaining 22 states in proportion to their sample sizes.

Sample size for women's interviews

As many of the key indicators that were to be generated from NFHS-3, such as those pertaining to family planning practices and maternal and child health, refer to ever-married women in the reproductive ages, the target sample size in NFHS-3 was fixed in terms of ever-married women age 15-49 years. Based on previous survey experience, it was decided to select an initial target sample size of 1,500 completed interviews with ever-married women in states with a 2001 Census population less than 5 million, 3,000 completed interviews with ever-married women in states with a 2001 Census population between 5 and 30 million, and 4,000

completed interviews with ever-married women in states with a population of more than 30 million. The initial target sample size in Uttar Pradesh, the largest Indian state with about one-sixth of the country's population, was fixed at 10,000 ever-married women. The initial target sample size for the 29 states is given in the following table.

State	Initial target sample size for ever-married women age 15-49
Arunachal Pradesh, Manipur, Meghalaya, Mizoram, Nagaland, Sikkim, Tripura	1,500
Assam, Chhattisgarh, Delhi, Goa, Haryana, Himachal Pradesh, Jammu & Kashmir, Jharkhand, Punjab, Uttarakhand	3,000
Andhra Pradesh, Bihar, Gujarat, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Rajasthan, Tamil Nadu, West Bengal	4,000
Uttar Pradesh	10,000

However, in the states with the cities for which slum/non-slum estimates were to be produced and in the states for which separate estimates of HIV were to be produced, these initial state sample sizes were not sufficient and needed to be adjusted upwards.

Adjustments to the initial sample size in specific states. Based on the general assumption that a robust estimation of most population and health indicators requires a minimum sample of 1,000 ever-married women, the target sample size for the eight cities with separate slum and non-slum estimates was fixed at a minimum of 2,000 interviews with ever-married women (equally distributed between slum and non-slum areas of each city). In addition, adjustments needed to be made to the initial sample size in states with separate HIV prevalence estimates. These considerations resulted in the following adjustments to the initial sample size of ever-married women age 15-49 in specified states:

State	Adjusted target sample size of ever-married women 15-49	Reason for adjustment
Andhra Pradesh	6,500	To allow for a state-level estimate of HIV prevalence and slum/non-slum estimates for Hyderabad.
Karnataka	5,600	To allow for a state-level estimate of HIV prevalence.
Madhya Pradesh	6,000	To allow for slum/non-slum estimates for Indore.
Maharashtra	8,000	To allow for a state-level estimate of HIV prevalence and slum/non-slum estimates for Mumbai and Nagpur.
Manipur	4,250	To allow for a state-level estimate of HIV prevalence.
Nagaland	4,500	To allow for a state-level estimate of HIV prevalence.
Tamil Nadu	6,250	To allow for a state-level estimate of HIV prevalence and slum/non-slum estimates for Chennai.
Uttar Pradesh	11,000	To allow for slum/non-slum estimates for Meerut. (The initial target sample size was already sufficient to produce HIV estimates.)
West Bengal	5,750	To allow for slum/non slum estimates for Kolkata.

To the extent possible, each state sample size was allocated to urban and rural areas in proportion to the population in the 2001 Census. However, in all those states for which city-level estimates were required, a larger proportion of the target sample was allocated to urban areas.

The target sample size, which was fixed in terms of ever-married women, was transformed into the number of households to be covered by assuming the number of ever-married women per household was the same as observed in NFHS-2. With the assumption that on average 30 households would be interviewed in each primary sampling unit (PSU), the number of PSUs to be surveyed in urban and rural areas of all states and the eight cities selected for slum/non slum measures was estimated.

Sample size for men's interviews

It has already been mentioned that most of the population and health indicators to be measured in NFHS-3 refer to ever-married women and their children and are estimated from women's interviews. Estimation of these indicators, particularly for children, needs a fairly large sample size to produce robust estimates for subgroups of the population. The required sample size for men's interviews is considerably smaller because the men's interviews were not designed to produce indicator estimates for their children. Hence, it was decided to interview men only from a subsample of households except in the states for which separate HIV prevalence estimates were required. In those seven states, men from all the selected households would be interviewed.

Sampling Design

NFHS-3 adopted a two-stage sample design in most rural areas and a three-stage sample design in most urban areas. In each state, the rural sample was typically selected in two stages: the first stage involved selection of Primary Sampling Units (PSUs), i.e., villages, with probability proportional to population size (PPS); the second stage involved the systematic selection of households within each PSU.

The basic reason for adopting a three-stage sample design in urban areas is that urban wards are quite large, making it difficult to list all the households in a ward and select households directly from the resulting list. Although data on census enumeration blocks (CEBs) in all wards were collected in the 2001 Census, these data were not available in published form; hence, it was not possible to select CEBs directly from an existing list of CEBs for the urban part of a state. For this reason, the selection of the urban sample (in all urban areas except in the eight cities for which slum and non-slum estimates were to be provided) involved the following three stages: in the first stage, wards were selected with PPS sampling; in the next stage, one CEB was selected by PPS from each selected ward; and in the final stage, households were randomly selected within each selected CEB. However, CEB-wise data was made available by the Registrar General of India on special request for the eight cities for which slum/non-slum estimates were planned; hence in these eight cities, the sample households were selected in two stages. First slum and non-slum CEBs were selected, and then households were selected from selected CEBs.

Sample selection in rural areas

Sampling frame. In rural areas, the 2001 Census list of villages served as the sampling frame. The Primary Census Abstract (PCA) by the Census of India, 2001, provides data on the number

of households, persons, males, females, literates, persons belonging to the scheduled castes (SC), persons belonging to the scheduled tribes (ST), employed persons, etc. for all the villages in each district of India. All the villages with fewer than five households were removed from this list. Since the population in all such villages was only 0.02 percent of the total rural population, the exclusion of small villages from the sampling frame is not expected to disturb the representativeness of the sample. Further, to ensure the selection of a sufficient number of households in the selected PSUs, all the smaller villages with 5-49 households were linked with a nearby village. In some cases, more than two villages had to be linked to form a group of villages with a minimum of 50 households. In this way, a minimum size of 50 households in each village was ensured in all the villages in the sampling frame.

Stratification. To ensure the inclusion of villages with different socioeconomic characteristics in the sample, stratified sampling was adopted at the first stage of sample selection. All the villages (or groups of villages) were stratified by a number of variables. The first level of stratification was geographic, with districts being subdivided into contiguous regions. The categorization of districts in different regions in each state is shown in Table C.1. In some states, a single district comprised a region.

Within each of these regions, villages were further stratified using selected variables from the following list: village size, percentage of males working in the nonagricultural sector, percentage of the population belonging to scheduled castes or scheduled tribes, and female literacy. In addition to these variables, districts in high HIV prevalence states were stratified according to HIV prevalence. For this purpose, the classification of all the districts in the six high HIV prevalence states as ‘high’, ‘medium’, and ‘low’ prevalence districts by NACO was adopted. Female literacy was used for implicit stratification (i.e., the villages were ordered prior to selection according to the proportion of females who were literate) in most states, although female literacy was an explicit stratification variable in a few states. The list of variables used for explicit and implicit stratification in each state is given in Table C.2.

The number of PSUs to be selected from each stratum was proportional to the stratum size. In each stratum, an independent sample of PSUs was drawn using PPS sampling.

Sampling frame at the second stage. A household listing operation carried out in each sample area provided the necessary frame for selecting households at the second stage. The household listing operation involved preparing up-to-date location and layout sketch maps, assigning a number to each structure, recording addresses of these structures, identifying residential structures, and then listing the names of heads of households. Listing of all households in large villages with 500 or more households is a huge task, potentially prone to errors of omission or duplication. Hence, large villages with about 500 or more households were segmented into three or more segments (depending on village size) of approximately equal size (usually about 100 to 200 households). From all the segments in each large village, two segments were selected using PPS sampling. Houselisting was then done only in the two selected segments. In all such large villages, the sampling design became a three-stage design.

The selection of the required number of households was done using systematic sampling. For the logistical convenience of the fieldwork and to minimize refusals, runs of five consecutive households, rather than single households, were selected systematically.

Selection of households. The number of households selected in a rural PSU was the product of number of households listed in the PSU and the probability of selection of a household in the selected rural PSU.

The probability of selecting a household from a selected rural PSU (f_2) of a specific state was computed as:

$$f_2 = \frac{f}{f_1}$$

where f , the domain sampling fraction (i.e., the probability of selecting an ever-married woman in the rural area of a state), is computed as:

$$f = \frac{n}{N}$$

where

- n = number of ever-married rural women to be interviewed (after adjusting upward to account for nonresponse and other loss), and
- N = projected rural population of ever-married women in the state in March 2006 (the midpoint of the NFHS-3 survey period).

The probability of selecting a PSU from a rural stratum of a state (f_1) was computed as:

$$f_1 = \frac{a * s_i}{\sum s_i}$$

where

- a = number of rural PSUs selected from the stratum,
- s_i = population size of the i^{th} PSU, and
- $\sum s_i$ = total rural population of the stratum.

Sample selection in urban areas

The following discussion refers to sampling in all the urban areas of the states in which no separate city estimates were planned. In Andhra Pradesh, Madhya Pradesh, Maharashtra, Uttar Pradesh, Tamil Nadu, and West Bengal, the following procedure was adopted for sampling in all urban areas excluding the cities in which slum/non-slum estimates were planned. This procedure was not applied to sampling in urban areas of Delhi.

Sampling frame. In urban areas, the sampling frame for the first stage of selection was the list of all the wards in a state. The Primary Census Abstract (PCA) provides details of all the wards in each city or town in urban areas. The list was arranged by geographical regions and then by female literacy. A sample of urban wards was drawn from the list of wards by PPS sampling.

Sample selection at the second and third stages. As mentioned earlier, the sample of households from a selected ward was drawn by adopting two-stage sampling. A ward in a

township is a large area comprising a large number of households. Each ward comprises several enumeration blocks (CEB) created for the census. A list of all the CEBs in a selected ward formed the sampling frame at the second stage. Such lists of CEBs in the selected wards were made available for use for NFHS-3 by the census office on request. Each CEB is comprised of about 150-200 households. A sample of households from a ward was drawn in two stages. One CEB was selected from each selected ward at the first stage. Then in each selected CEB, a household listing operation was carried out (similar to the listing operation in rural PSUs). The household listing provided the necessary frame for selecting households at the third stage. The selection of the required number of households from the list of households was done using systematic sampling. As in rural areas, systematically selected groups of five consecutive households, rather than a single household, were selected.

Similar to rural PSUs, the sample size of households was not the same in every urban PSU. The sample size of households in an urban PSU was obtained by applying the probability of selection of an ever-married woman in an urban PSU (f_3) to the total number of households listed in the urban PSU.

The domain sampling fraction, i.e., the probability of selecting an ever-married woman from an urban domain in a state (f), was computed as:

$$f = \frac{n}{N}$$

where

n = number of ever-married women to be interviewed from the urban domain (after adjusting upward to account for nonresponse and other loss), and
 N = projected population of ever-married women in the urban domain in March 2006.

The probability of selecting a ward from an urban stratum (f_1) was computed as:

$$f_1 = \frac{a * s_i}{\sum s_i}$$

where

a = number of wards selected from the stratum,
 s_i = population size of the i^{th} ward, and
 $\sum s_i$ = total population of the urban stratum.

The probability of selecting a CEB from a selected ward (f_2) was computed as:

$$f_2 = \frac{B_i}{\sum B_i}$$

where

B_i = population size of the i^{th} CEB, and
 $\sum B_i$ = total population of the ward.

The probability of selecting a household from a selected block (f_3) was computed as:

$$f_3 = \frac{f}{f_1 * f_2}$$

Sample selection in eight cities

In the eight cities for which separate indicators for slum and non-slum areas were to be provided, a different sampling procedure was adopted. As mentioned above, sample households in the cities were selected with a two-stage sampling design. At the first stage CEBs were selected and at the second stage households were selected. In each city, slum and non-slum PSUs were selected independently from the respective lists of slum and non-slum CEBs. For the estimation of the number of households and the selection of households from the selected slum/non-slum PSUs (CEBs), a procedure similar to that used for rural and urban PSUs was adopted.

Sampling frame. As mentioned above, although the Census of India collects and compiles data by CEBs, that information is not published. However, on special request for NFHS-3, the Registrar General of India made available CEB-wise data for the eight cities for which slum and non-slum estimates were to be provided. Two separate lists of all the slum CEBs and non-slum CEBs in all the wards of each city served as two separate sampling frames at the first stage of selection. From each sampling frame, slum and non-slum PSUs were selected using PPS sampling. The houselisting carried out in each of the selected CEBs served as the sampling frame for the selection of households.

Sample weights

The basic objective of weighting sample data is to try and maximize the representativeness of the sample in terms of the size, distribution, and characteristics of the study population. When sample units have been selected with differing probabilities, it is common to weight the results inversely proportional to the unit selection probabilities, i.e., the design weight, so as to reflect the actual situation in the population. In a survey sample selected from a robust frame and well implemented with high response rates, the application of the design weight is all that is required. In practice, however, the situation is more complicated because of shortcomings in the selection and implementation of the sample.

In NFHS-3, two sets of weights are in operation. One set of weights is used for generating national-level indicators and another set is used for producing state-level indicators. Each set has the following different types of weights:

1. *Household weight* for estimating indicators such as the proportion of female-headed households and the percentage of children age 0-4 years whose birth was registered.
2. *Woman's weight* for generating indicators such as the contraceptive prevalence rate and the percentage of children age 12-23 months who are fully immunized.
3. *Man's weight* for estimation of indicators such as the proportion of men who have heard of AIDS.

4. *HIV weight* for women for generating indicators such as HIV prevalence by age for women.
5. *HIV weight* for men for generating indicators such as HIV prevalence by age for men.
6. *Domestic violence weight* for estimating indicators such as the proportion of married women who have ever experienced spousal violence.

Note that children of interviewed women are assigned the weight of their mother. Some child indicators are assessed at the household level; in such cases, children are assigned the weight of the household.

Calculation of sampling weights

Calculation of state and national household weights. The basic reasons for weighting primary data while estimating state-level indicators are:

- a) To take care of the non-equal probability of selection in different domains, i.e., rural and urban areas and slum and non-slum areas in the seven states of Andhra Pradesh, Delhi, Madhya Pradesh, Maharashtra, Tamil Nadu, Uttar Pradesh, and West Bengal. In each state, the total sample size was distributed between urban and rural areas according to the proportion of urban-rural households. However, oversampling was done in urban areas in states with very small urban populations in order to have a sample large enough to yield stable estimates; oversampling was also done in the cities where slum and non-slum estimates were required in order to have large enough samples in the slum areas and the non-slum areas separately. Whatever the reason, oversampling of urban areas of some states leads to unequal probabilities of selection.
- b) To take care of the differential non-response rates of household interviews in different domains, namely urban and rural areas and slum and non-slum areas of the eight cities.

To take care of the non-equal probabilities of selection in different domains, a design weight was computed. The household design weight W_{Di} for the i^{th} domain is the inverse of the sampling fraction for the i^{th} domain ($f_i = n_i/N_i$). To take care of differential nonresponse in different domains, the design weight for each domain is multiplied by the inverse of the response rates.

The household weight (W_{Hi}) for the i^{th} domain is then:

$$W_{Hi} = \frac{W_{Di}}{R_{Hi}}$$

where

R_{Hi} = response rate of the household interview (number of completed household interviews divided by the number of households selected for interview)

After adjustment for nonresponse, the weights are normalized so that the total number of weighted cases is equal to the total number of unweighted cases. This is done by multiplying W_{Hi} for each domain by the ratio of total number of unweighted cases to total number of weighted cases (obtained by applying weights before normalization to the number of cases in each domain).

The final state household weight is calculated as

$$\hat{W}_{Hi} = W_{Hi} * \left[\frac{\sum n_i}{(\sum W_{Hi} * n_i)} \right]$$

Because of the normalization of the state household weight at the state level, the normalized state household weight cannot be used for national indicators. A set of national weights is thus calculated. The final national household weight is based on the state household weight W_{Hi} (after correction for nonresponse and before normalization at the state level) normalized at the national level.

Calculation of state and national women’s and men’s weights. The state level and national level women’s weights are derived exactly the same way as the household weights. The only difference is that the response rate of the household interview is replaced by the response rate of the household interview (R_{Hi}) times the response rate of the women’s interview (R_{Wi}). The eligible women’s weight is:

$$W_{Wi} = \frac{W_{Di}}{R_{Hi} * R_{Wi}}$$

Normalization of W_{Wi} at the individual state level gives the state’s normalized women’s weight; normalization at the national level for all states together gives the all-India normalized women’s weight.

Men’s weights are calculated in the same way by incorporating the men’s response rates.

The state and national HIV household weights and HIV individual weights are also calculated in a similar fashion. The only difference is the normalization of the individual HIV weights. Since HIV prevalence is reported not only for women and men separately, but also for women and men together, the individual HIV weights must be normalized for women and men together at the individual state level and at the national level, respectively.

Calculation of state and national domestic violence weights. Unlike all other sections of the Woman’s Questionnaire, the section on domestic violence was not administered to all women in the household. This was part of a strategy built into the questionnaire to maintain confidentiality and to protect respondents from any potential security-related problems. Only one eligible woman in each selected household was administered the section on domestic violence. In households with more than one eligible woman, the woman that the module was administered to was randomly selected through a specially designed simple selection procedure based on the

Kish Grid (see the NFHS-3 Household Questionnaire) which was built into the Household Questionnaire.

The selection of one woman per sample household implies that women who were selected for the domestic violence module of the questionnaire are a subsample of the entire NFHS-3 sample. This subsampling results in the need to generate one additional set of weights for estimating state and national indicators of domestic violence. The domestic violence weights (DW_{wi}) are calculated the same way as other weights but they also take account of the number of eligible women in the household.

The domestic violence weight for women is:

$$DW_{wi} = \frac{W_{Di}}{R_{Hi} * S_{Hi} * DR_{wi}}$$

where

S_{Hi} = the inverse of the number of eligible women in the household, and

DR_{wi} = response rate of the women selected for the domestic violence module.

Normalization of DW_{wi} at the individual state level gives the state's normalized domestic violence weight; normalization at the national level for all states together gives the all-India normalized domestic violence weight.

Sample implementation

NFHS-3 response rates for households, women, and men were discussed in Chapter 1, Section 1.7. Tables C.3.1 and C.3.2 provide additional information on the reasons for non-response for women and men, respectively. Response rates for HIV blood collection were estimated separately and were discussed in Chapter 12.

Table C.1 Regions by state

State	Region	2001 Census districts
Andhra Pradesh	I	Srikakulam, Vizianagaram, Visakhapatnam
	II	East Godavari, West Godavari, Krishna, Guntur
	III	Prakasam, Nellore
	IV	Chittoor, Cuddapah, Anantapur, Kurnool
	V	Mahbubnagar, Rangareddi, Hyderabad, Medak, Nizamabad, Adilabad, Nalgonda
	VI	Karimnagar, Warangal, Khammam
Arunachal Pradesh	I	Tawang, West Kameng, East Kameng
	II	Papumpare, Lower Subansiri, Upper Subansiri
	III	West Siang, East Siang, Upper Siang
	IV	Darrang, Lohit
	V	Tirap, Changlang
Assam	I	Goalpara, Kamrup, Marigaon, Nagaon, Darrang
	II	Dhubri, Bongaigaon, Barpeta, Nalbari, Sonitpur
	III	Golaghat, Jorhat, Sibsagar, Dibrugarh, Tinsukia, Karimganj, Hailakandi, Cachar
	IV	Lakhimpur, Dhemaji
	V	Karbi Anglong
Bihar	I	Saran, Siwan, Gopalganj, Pashchim Champaran, Purba Champaran
	II	Sitamarhi, Vaishali, Darbhanga, Madhubani, Samastipur, Muzaffarpur, Saharsa, Sheohar, Supaul
	III	Purnia, Araria, Kishanganj, Katihar, Madhepura
	IV	Patna, Bhojpur, Rohtas, Buxor, Kaimur (Bhabua)
	V	Munger, Khagaria, Bhagalpur, Banka, Jamui, Lakhisarai, Sheikhpura
	VI	Nalanda, Gaya, Jehanabad, Aurangabad, Nawada, Begusarai
Chhattisgarh	I	Koriya, Surguja, Bilaspur, Korba, Janjgir-champa, Jashpur, Raigarh
	II	Kawaedha, rajnandgaon, Durg, Raipur, Mahasamund, Dhamtari
	III	Kanker, Bastar, Dantewada
Goa		Each district is one region
Gujarat	I	Jamnagar, Rajkot
	II	Surendranagar, Bhavnagar, Amreli
	III	Junagadh, Porbandar
	IV	Kachchh, Banaskantha
	V	Sabarkantha, Mahesana, Patan
	VI	Gandhinagar, Ahmedabad
	VII	Kheda, Anand
	VIII	Panch Mahals, Vadodara, Dohad
	IX	Bharuch, Surat, Valsad, The Dangs, Narmada, Navsari
Haryana	I	Faridabad, Gurgaon, Sonapat

¹ The population shown is the 2001 Census population, excluding persons living in villages with fewer than five households.

Table C.3.1 Sample implementation: Women

Percent distribution of households and eligible women by results of the household and individual interviews, and household, eligible women, and overall response rates, by residence, India, 2005-06

Result	Residence		Total
	Urban	Rural	
Selected households			
Completed (C)	92.3	94.5	93.5
Household present but no competent respondent at home (HP)	1.4	1.1	1.2
Postponed (P)	0.1	0.0	0.0
Refused (R)	1.4	0.2	0.8
Dwelling not found (DNF)	0.1	0.1	0.1
Household absent (HA)	2.2	2.0	2.1
Dwelling vacant/address not a dwelling (DV)	2.5	1.9	2.1
Dwelling destroy (DD)	0.1	0.2	0.1
Total	100.0	100.0	100.0
Number of sampled households	54,453	62,199	116,652
Household response rate (HRR) ¹	96.9	98.5	97.7
Eligible women			
Completed (EWC)	93.3	95.5	94.5
Not at home (EWNH)	3.4	2.6	2.9
Postponed (EWP)	0.1	0.0	0.1
Refused (EWR)	2.3	0.8	1.5
Partly completed (EWPC)	0.3	0.2	0.2
Incapacitated (EWI)	0.4	0.6	0.5
Other (EWO)	0.3	0.2	0.3
Total	100.0	100.0	100.0
Number of women	61,028	70,568	131,596
Eligible women response rate (EWRR) ²	93.3	95.5	94.5
Overall response rate (ORR) ³	90.4	94.1	92.4

¹ Using the number of households falling into specific response categories, the household response rate (HRR) is calculated as:

$$\frac{100 * C}{C + HP + P + R + DNF}$$

² Using the number of eligible women falling into specific response categories, the eligible women response rate (EWRR) is calculated as:

$$\frac{100 * EWC}{EWC + EWNH + EWP + EWR + EWPC + EWI + EWO}$$

³ The overall response rate (ORR) is calculated as:

$$ORR = HRR * EWRR/100$$

Table C.3.2 Sample implementation: Men

Percent distribution of households and eligible men by results of the household and individual interviews, and household, eligible men, and overall response rates, by residence, India, 2005-06

Result	Residence		Total
	Urban	Rural	
Selected households			
Completed (C)	91.8	94.3	93.1
Household present but no competent respondent at home (HP)	1.3	1.2	1.3

Incapacitated (EMI)	0.5	0.8	0.7
Other (EMO)	0.4	0.4	0.4
Total	100.0	100.0	100.0
Number of men	45,133	40,240	85,373
Eligible men response rate (EMRR) ²	84.6	89.9	87.1
Overall response rate (ORR) ³	81.8	88.4	84.9

¹ Using the number of households falling into specific response categories, the household response rate (HRR) is calculated as:

$$\frac{100 * C}{C + HP + P + R + DNF}$$

² Using the number of eligible men falling into specific response categories, the eligible men response rate (EMRR) is calculated as:

$$\frac{100 * EMC}{EMC + EMNH + EMP + EMR + EMPC + EMI + EMO}$$

³ The overall response rate (ORR) is calculated as:

$$ORR = HRR * EMRR/100$$

The estimates from a sample survey are affected by two types of errors: (1) nonsampling errors, and (2) sampling errors. Nonsampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the third National Family Health Survey 2005-06 (NFHS-3) to minimize this type of error, nonsampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-3 is only one of many samples that could have been selected from the same population, using the same design and expected size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability between all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the *standard error* for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-3 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-3 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rate and child mortality rates.

The Taylor linearization method treats any percentage or average as a ratio estimate, $r = y/x$, where y represents the total sample value for variable y , and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^2(r) = var(r) = \frac{1-f}{x^2} \sum_{h=1}^H \left[\frac{m_h}{m_h - 1} \left(\sum_{i=1}^{m_h} z_{hi}^2 - \frac{z_h^2}{m_h} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}, \text{ and } z_h = y_h - rx_h$$

where h represents the stratum which varies from 1 to H ,
 m_h is the total number of clusters selected in the h^{th} stratum,
 y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} stratum,
 x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum, and
 f is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers *all but one* clusters in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-3 sample, there were 3850 non-empty clusters. Hence, 3850 replications were created. The variance of a rate r is calculated as follows:

$$SE^2(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^k (r_i - r)^2$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where r is the estimate computed from the full sample of 3850 clusters,
 $r_{(i)}$ is the estimate computed from the reduced sample of 3849 clusters (i^{th} cluster excluded), and
 k is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. Relative standard error (SE/R) and confidence limits ($R \pm 2SE$) for each estimate are also computed.

Sampling errors for NFHS-3 are calculated for selected variables considered to be of primary interest for woman's survey and for man's surveys, respectively. The results are presented in this appendix for the country as a whole, and for the urban and rural areas. For each variable, the type of statistic (mean, proportion, or rate) and the base population are given in Table D.1. Table D.2 presents the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ($R \pm 2SE$), for each variable. The DEFT is

considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1). In the case of the total fertility rate, the number of unweighted cases is not relevant, as there is no known unweighted value for woman-years of exposure to childbearing.

Table D.1 List of variables for sampling errors, India, 2005-06

Variable	Estimate	Base population
Sex ratio (females per 1,000 males)	Ratio	De facto household population, all ages
No education	Proportion	De facto household population age 6+
Tuberculosis prevalence	Rate	100,000 usual household residents
Using adequately iodized salt	Proportion	Households
Urban residence	Proportion	Women/men age 15-49
No education	Proportion	Women/men age 15-49
Completed 12 or more years of education	Proportion	Women/men age 15-49
Never married, including married <i>gauna</i> not performed	Proportion	Women/men age 15-49
Currently married	Proportion	Women/men age 15-49
Married before age 18	Proportion	Women age 20-49
Married before age 21	Proportion	Men age 25-49
Children ever born	Mean	Women age 15-49
Children surviving	Mean	Women age 15-49
Ever used any contraceptive method	Proportion	Currently married women age 15-49
Currently using any method	Proportion	Currently married women age 15-49
Currently using a modern method	Proportion	Currently married women age 15-49
Currently using a traditional method	Proportion	Currently married women age 15-49
Currently using female sterilization	Proportion	Currently married women age 15-49
Currently using pill	Proportion	Currently married women age 15-49
Currently using IUD	Proportion	Currently married women age 15-49
Currently using condom	Proportion	Currently married women age 15-49
Using public medical sector source of contraception	Proportion	Women age 15-49 currently using modern methods of contraception
Want no more children	Proportion	Currently married women/men age 15-49
Want to delay next birth at least 2 years	Proportion	Currently married women/men age 15-49
Ideal number of children	Mean	Women/men age 15-49
Mother received ANC from health personnel	Proportion	Women with at least one birth in last five years (last birth)
Took iron or folic acid (IFA) for 90 days or more	Proportion	Women with at least one birth in last five years (last birth)
Births delivered by a skilled provider	Proportion	Births in last 5 years
Institutional delivery	Proportion	Births in last 5 years
Postpartum check for mother within 2 days of birth	Proportion	Women with at least one birth in last five years (last birth)
Treated with ORS packets	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Children with diarrhoea taken to a health provider	Proportion	Children under age 5 years with diarrhoea in last 2 weeks
Child's vaccination card seen by interviewer	Proportion	Children age 12-23 months
Child received BCG vaccination	Proportion	Children age 12-23 months
Child received DPT vaccination (3 doses)	Proportion	Children age 12-23 months
Child received polio vaccination (3 doses)	Proportion	Children age 12-23 months
Child received measles vaccination	Proportion	Children age 12-23 months
Child fully vaccinated	Proportion	Children age 12-23 months
Given vitamin A supplement in last 6 months	Proportion	Children age 6-59 months
Ever experienced physical or sexual violence	Proportion	Women age 15-49
Weight-for-height, wasting (below -2SD)	Proportion	Children under age 5 years who were measured
Height-for-age, stunting (below -2SD)	Proportion	Children under age 5 years who were measured
Weight-for-age, underweight (below -2SD)	Proportion	Children under age 5 years who were measured
Body mass index (BMI) < 18.5	Proportion	Women/men age 15-49 who were measured
Body mass index (BMI) ≥ 25.0	Proportion	Women/men age 15-49 who were measured
Have heard of AIDS	Proportion	Women/men age 15-49
Comprehensive knowledge about HIV/AIDS	Proportion	Women/men age 15-49
Total and age-specific fertility rates (last 3 years)	Rate	Women
Mortality rates	Rate	Births in last 5 years
Women/men with any anaemia	Proportion	Women/men age 15-49
Children with any anaemia	Proportion	Children age 6-59 months
HIV prevalence	Proportion	Women/men/total age 15-24, women/men/total age 15-49

Table D.2 Sampling errors, India, 2005-06

Note: The de facto population includes residents and nonresidents who stayed in the household the night before the interview.

Table E.2.1 Age distribution of eligible and interviewed women

De facto household population of women age 10-54, interviewed women age 15-49, and percentage of eligible women who were interviewed (weighted), by five-year age groups, India, 2005-06

Age group	Household population of women age 10-54	Interviewed women age 15-49		Percentage of eligible women interviewed
		Number	Percent	
10-14	29,511	na	na	na
15-19	24,954	23,779	19.2	95.3
20-24	23,320	22,092	17.8	94.7
25-29	22,040	20,969	16.9	95.1
30-34	18,183	17,421	14.0	95.8
25-39	17,596	16,830	13.6	95.6
40-44	13,271	12,686	10.2	95.6
45-49	10,895	10,312	8.3	94.6
50-54	10,353	na	na	na
15-49	130,259	124,088	100.0	95.3

Note: The de facto population includes all residents and nonresidents who stayed in the household the night before the interview. For all columns, the age distribution is taken from the ages reported on the Household Questionnaire. The total number of interviewed women in this table differs from the number in earlier tables because this table uses household weights rather than individual weights for the calculations.

na = Not applicable

Table E.2.2 Age distribution of eligible and interviewed men

De facto household population of men age 10-59, interviewed men age 15-54, and percentage of eligible men who were interviewed (weighted), India, 2005-06

Age group	Household population of men age 10-59	Interviewed men age 15-54		Percentage of eligible men interviewed
		Number	Percent	
10-14	21,150	na	na	na
15-19	14,570	13,113	17.6	90.0
20-24	13,290	11,723	15.8	88.2
25-29	12,247	10,720	14.4	87.5
30-34	10,528	9,256	12.4	87.9
25-39	11,007	9,727	13.1	88.4
40-44	8,962	7,906	10.6	88.2
45-49	7,942	7,073	9.5	89.1
50-54	5,531	4,850	6.5	87.7
55-59	5,609	na	na	na
15-54	84,078	74,369	100.0	88.5

Note: The de facto population includes all residents and nonresidents who stayed in the household the night before the interview. For all columns, the age distribution is taken from the ages reported on the Household Questionnaire. The total number of interviewed men in this table differs from the number in earlier tables because this table uses household weights rather than individual weights for the calculations.

Table E.3 Completeness of reporting

Percentage of observations missing information for selected demographic and health questions/measures (weighted), India, 2005-06

Subject	Reference group	Percentage with missing information	Number of cases
Birth date	Births in the 15 years before the survey		
Month only		1.23	180,641
Month and year		0.17	180,641
Age at death	Deceased children born in the 15 years preceding the survey	0.09	16,424
Age/date at first marriage¹			
Women	Ever-married women age 15-49	0.11	98,923
Men	Ever-married men age 15-54	0.06	49,422
Respondent's education			
Women	Women age 15-49	0.01	124,385
Men	Men age 15-54	0.02	74,369
Diarrhoea in past two weeks	Children age 0-59 months	0.40	52,868
Anthropometry: Women	Women age 15-49 (from the Household Questionnaire)		
Height		8.44	130,259
Weight		8.42	130,259
Height or weight		8.46	130,259
Anthropometry: Men	Men age 15-54 (from the Household Questionnaire)		
Height		16.37	84,078
Weight		16.31	84,078
Height or weight		16.39	84,078
Anthropometry: Children	Children age 0-59 months (from the Household Questionnaire)		
Height		11.83	56,084
Weight		11.46	56,084
Height or weight		11.86	56,084
Anaemia			
Women	Women age 15-49 (from the Household Questionnaire)	10.27	130,259
Men	Men age 15-54 (from the Household Questionnaire)	17.69	84,078
Children	Children age 6-59 months (from the Household Questionnaire)	16.31	50,651

¹ Both year and age missing.

Table E.4 Births by calendar year

Number of births, percentage with complete birth date, sex ratio at birth, and calendar year ratio by calendar year, according to living (L), dead (D), and total (T) children (weighted), India, 2005-06

Calendar year	Number of births			Percentage with complete birth date ¹			Sex ratio at birth ²			Calendar year ratio ³		
	L	D	T	L	D	T	L	D	T	L	D	T

Missing	2	0	2	0	4
Total 0-11 months	3,093	4,477	4,629	4,235	16,433
Percent neonatal ¹	70.1	69.0	67.7	64.1	67.6

^a Includes deaths under one month reported in days.

¹ <1 month/<12 months

The three core questionnaires (the Household Questionnaire, the Woman’s Questionnaire, and the Man’s Questionnaire) used in NFHS-3 are presented in this appendix. These questionnaires were used in all 29 states. However, since the fieldwork for NFHS-3 was conducted in two phases that spanned parts of two calendar years (2005 and 2006), the reference period for questions/sections that were reference-period specific was different for Phase 1 and Phase 2 states¹. The table below gives a list of the affected sections and questions with the reference year for the two phases of fieldwork.

Questionnaire	Section and question number	Reference year	
		Phase 1 states	Phase 2 states
Household	Biomarkers for children (Qs. 69-84)	2000	2001
Woman’s	Section 2: Q. 225, Q. 226, Q. 228, Q. 229, and Qs. 233-239	2000	2001
	Section 3: Q. 302, Q. 314, Q. 343, and Q. 344	2000	2001
	Section 4: Qs. 401-477	2000	2001
	Section 4: Qs. 478-482	2002	2003
	Section 5: Qs. 501-556 and Q. 576	2000	2001
	Section 5A: Qs. 577-591	1999	2000
	Calendar	2000	2001

NFHS-3 questionnaires, shown here in English, were translated into 18 languages. Questionnaires in each state were bilingual, with questions in both the principal language of the state and English.

¹ Fieldwork was conducted from November 2005 to May 2006 (Phase 1) in Andhra Pradesh, Assam, Chhattisgarh, Delhi, Gujarat, Maharashtra, Meghalaya, Orissa, Punjab, Rajasthan, Uttar Pradesh, and West Bengal. Fieldwork was conducted from April 2006 to August 2006 (Phase 2) in Arunachal Pradesh, Bihar, Goa, Haryana, Himachal Pradesh, Jammu and Kashmir, Jharkhand, Karnataka, Kerala, Manipur, Madhya Pradesh, Mizoram, Nagaland, Sikkim, Tamil Nadu, Tripura, and Uttaranchal.

TICK HERE IF CONTINUATION QUESTIONNAIRE USED

4A Just to make sure that I have a complete household listing:

a) Are there any other persons such as small children or infants that we have not listed? YES ENTER EACH IN TABLE NO

b) Are there any other people who may not be members of your family such as domestic servants, lodgers or friends who usually live here? YES ENTER EACH IN TABLE NO

c) Are there any guests or temporary visitors staying here, or anyone else who stayed here last night, who have not been listed? YES ENTER EACH IN TABLE NO

- (A) CODES FOR Q. 3**
RELATIONSHIP TO HEAD OF HOUSEHOLD:
 01 = HEAD
 02 = WIFE OR HUSBAND
 03 = SON OR DAUGHTER
 04 = SON-IN-LAW OR DAUGHTER-IN-LAW
 05 = GRANDCHILD
 06 = PARENT
 07 = PARENT-IN-LAW
 08 = BROTHER OR SISTER
 09 = BROTHER-IN-LAW OR SISTER-IN-LAW
 10 = NIECE/NEPHEW
 11 = OTHER RELATIVE
 12 = ADOPTED/FOSTER/STEP-CHILD
 13 = DOMESTIC SERVANT
 14 = OTHER NOT RELATED
 98 = DON'T KNOW

- (B) CODES FOR Q. 7**
AGE
 00 = AGE LESS THAN ONE YEAR
 95 = AGE 95 YEARS OR MORE

- (C) CODES FOR Q. 8**
MARITAL STATUS
 1 = CURRENTLY MARRIED
 2 = MARRIED, BUT GAUNA NOT PERFORMED
 3 = WIDOWED
 4 = DIVORCED
 5 = SEPARATED
 6 = DESERTED
 7 = NEVER MARRIED
 8 = DON'T KNOW

- (D) CODES FOR Q. 12**
BIRTH REGISTRATION
 C = CERTIFICATE
 R = REGISTRATION
 N = NEITHER
 DK = DON'T KNOW

- (E) CODES FOR Qs. 17, 19, AND 21**
EDUCATION STANDARD:
 00 = LESS THAN 1 YEAR COMPLETED
 (FOR Q.17 ONLY. THIS CODE IS NOT ALLOWED FOR Qs. 19 AND 21)
 98 = DON'T KNOW

- (F) CODES FOR Q. 22**
REASON FOR NOT ATTENDING SCHOOL
 01 = SCHOOL TOO FAR AWAY
 02 = TRANSPORT NOT AVAILABLE
 03 = FURTHER EDUCATION NOT CONSIDERED NECESSARY
 04 = REQUIRED FOR HOUSEHOLD WORK
 05 = REQUIRED FOR WORK ON FARM/FAMILY BUSINESS
 06 = REQUIRED FOR OUTSIDE WORK FOR PAYMENT IN CASH OR KIND
 07 = COSTS TOO MUCH
 08 = NO PROPER SCHOOL FACILITIES FOR GIRLS
 09 = NOT SAFE TO SEND GIRLS
 10 = NO FEMALE TEACHER
 11 = REQUIRED FOR CARE OF SIBLINGS
 12 = NOT INTERESTED IN STUDIES
 13 = REPEATED FAILURES
 14 = GOT MARRIED
 15 = DID NOT GET ADMISSION
 96 = OTHER
 98 = DON'T KNOW

- (G) CODES FOR Qs. 24, 27, AND 29**
HOURS WORKED:
 00 = LESS THAN 1 HOUR
 95 = 95 HOURS OR MORE

* In Mumbai and Kolkata, this version of Q. 58 was used.

TABLE FOR SELECTION OF WOMEN FOR THE HOUSEHOLD RELATIONS QUESTIONS

INSTRUCTIONS

LOOK AT THE LAST DIGIT OF THE QUESTIONNAIRE NUMBER ON THE COVER PAGE. THIS IS THE ROW NUMBER YOU SHOULD CIRCLE. CHECK THE TOTAL NUMBER OF ELIGIBLE WOMEN ON THE COVER SHEET OF THE HOUSEHOLD QUESTIONNAIRE. THIS IS THE COLUMN NUMBER YOU SHOULD CIRCLE. FIND THE BOX WHERE THE CIRCLED ROW AND THE CIRCLED COLUMN MEET AND CIRCLE THE NUMBER THAT APPEARS IN THE BOX. THIS IS THE NUMBER OF THE ELIGIBLE WOMAN WHO WILL BE ASKED THE HOUSEHOLD RELATIONS QUESTIONS. THEN, GO TO COLUMN (9) IN THE HOUSEHOLD SCHEDULE AND PUT A * NEXT TO THE HOUSEHOLD LINE NUMBER OF THE SELECTED ELIGIBLE WOMAN AND RECORD THIS HOUSEHOLD LINE NUMBER IN THE TWO BOXES AT THE BOTTOM OF THIS TABLE.

FOR EXAMPLE, IF THE HOUSEHOLD QUESTIONNAIRE NUMBER IS '3716', GO TO ROW 6 AND CIRCLE THE ROW NUMBER ('6'). IF THERE ARE THREE ELIGIBLE WOMEN IN THE HOUSEHOLD, GO TO COLUMN 3 AND CIRCLE THE COLUMN NUMBER ('3'). DRAW LINES FROM ROW 6 AND COLUMN 3 AND FIND THE BOX WHERE THE TWO MEET, AND CIRCLE THE NUMBER IN IT ('2'). THIS MEANS YOU HAVE TO SELECT THE SECOND ELIGIBLE WOMAN. SUPPOSE THE HOUSEHOLD LINE NUMBERS OF THE THREE ELIGIBLE WOMEN ARE '02', '03', AND '07'; THEN THE ELIGIBLE WOMAN FOR THE HOUSEHOLD RELATIONS QUESTIONS IS THE SECOND ELIGIBLE WOMAN, I.E., THE WOMAN WITH HOUSEHOLD LINE NUMBER '03'. PUT A * NEXT TO THIS WOMAN'S LINE NUMBER IN COLUMN (9) OF THE HOUSEHOLD SCHEDULE AND ALSO ENTER THE TWO DIGIT LINE NUMBER IN THE TWO BOXES AT THE BOTTOM OF THIS TABLE.

LAST DIGIT OF THE QUESTIONNAIRE NUMBER	TOTAL NUMBER OF ELIGIBLE WOMEN IN THE HOUSEHOLD							
	1	2	3	4	5	6	7	8
0	1	2	2	4	3	6	5	4
1	1	1	3	1	4	1	6	5
2	1	2	1	2	5	2	7	6
3	1	1	2	3	1	3	1	7
4	1	2	3	4	2	4	2	8
5	1	1	1	1	3	5	3	1
6	1	2	2	2	4	6	4	2
7	1	1	3	3	5	1	5	3
8	1	2	1	4	1	2	6	4
9	1	1	2	1	2	3	7	5

HOUSEHOLD LINE NUMBER OF WOMAN SELECTED
FOR HOUSEHOLD RELATIONS SECTION

--	--

WEIGHT, HEIGHT AND BIOMARKER MEASUREMENT

CHECK COLUMNS (9), (10), AND (11): RECORD THE LINE NUMBER, NAME, AND AGE OF ALL WOMEN AGE 15-49 AND CHILDREN UNDER AGE 6. IF THE HOUSEHOLD IS SELECTED FOR MEN'S INTERVIEWS, ALSO RECORD THE LINE NUMBER, NAME, AND AGE OF ALL MEN AGE 15-54.

INFORMED CONSENT FOR ANAEMIA TESTING

As part of this survey, we are studying anaemia among women, men, and children under age 6 years. Anaemia is a serious health problem that usually results from poor nutrition, infection, or chronic disease. This information will assist the government to develop programmes to prevent and treat anaemia.

We request that (you/you and (NAME OF RESPONDENT'S CHILD(REN)/CHILD(REN) IN RESPONDENT'S CARE) born in 2001 or later participate in the anaemia testing part of this survey by giving a few drops of blood from a finger. The test uses disposable sterile instruments that are clean and completely safe. The blood will be tested with new equipment and the results of the test will be given to you immediately. The results will be kept confidential.

Do you have any questions?

ANSWER ANY QUESTIONS AND ADDRESS RESPONDENT'S/GUARDIAN'S CONCERNS.

May I now ask that (you/you and NAME OF RESPONDENT'S CHILD(REN)/CHILD(REN) IN RESPONDENT'S CARE) participate in the anaemia testing. However, if you decide not to have the test(s) done, it is your right and we will respect your decision. Now please tell me if you agree to have the test(s) done.

GO TO COLUMN 79, CIRCLE THE APPROPRIATE CODE, AND SIGN.

IF RESPONDENT IS AGE 15-17 AND NEVER MARRIED, ASK PARENT/GUARDIAN:

Now, will you tell me if you accept that (NAME OF YOUTH(S)) participate in the anaemia testing? GO TO COLUMN 78 AND WRITE THE LINE NUMBER OF THE PARENT/GUARDIAN. ASK FOR THEIR CONSENT. IF THE PARENT/GUARDIAN DOES NOT AGREE, CIRCLE CODE '2' IN COLUMN 79 AND SIGN. IF THE PARENT/GUARDIAN AGREES, READ THE PRECEDING PARAGRAPHS TO THE YOUTH FOR HIS/HER CONSENT, RECORD THE APPROPRIATE CODE IN COLUMN 79, AND SIGN. CIRCLE CODE '1' FOR 'GRANTED' ONLY IF BOTH THE PARENT/GUARDIAN AND THE YOUTH AGREE TO THE TESTING.

INFORMED CONSENT FOR HIV TEST FOR MEN AND WOMEN

In addition to studying anaemia, we are also studying HIV. HIV is the virus that causes AIDS.

In order to determine how prevalent HIV is in India, we are asking women and men throughout India to give a few drops of blood. The drops of blood will be collected from your finger (at the same time as we do your anaemia test) and sent to a laboratory for testing. To ensure complete confidentiality of the collected blood, no individual names will be attached to the blood sample. This means that no one, including me, will be able to trace the blood sample or the test result back to you. Since we are only collecting blood on a filter paper with no other identifying information, we cannot give you the result of the HIV test.

However, whether or not you choose to participate in this effort to estimate the prevalence of HIV in India, you will be given a voucher for a free HIV test at a health clinic where you can get your blood tested for HIV if you want and receive your results.

Do you have any questions?

ANSWER ANY QUESTIONS AND ADDRESS RESPONDENT'S CONCERNS.

I hope you will agree to give a few drops of blood from your finger for this very important country-wide effort, as it will help the government to develop programmes to prevent the spread of HIV and AIDS. However, if you decide not to participate, it is your right and we will respect your decision.

Do you agree to give a few drops of blood for anonymous HIV testing?

GO TO COLUMN 80 AND CIRCLE THE APPROPRIATE CODE AND SIGN.

IF RESPONDENT IS AGE 15-17 AND NEVER MARRIED, ASK THE PARENT/GUARDIAN:

Now, will you tell me if you accept that (NAME OF YOUTH(S)) participate in the HIV testing? IF THE PARENT/GUARDIAN DOES NOT AGREE, CIRCLE CODE '2' IN COLUMN 80 AND SIGN. IF THE PARENT/GUARDIAN AGREES, READ THE PRECEDING PARAGRAPHS TO THE YOUTH FOR HIS/HER CONSENT, RECORD THE APPROPRIATE CODE IN COLUMN 80, AND SIGN. CIRCLE CODE '1' FOR 'GRANTED' ONLY IF BOTH THE PARENT/GUARDIAN AND THE YOUTH AGREE TO THE TESTING.

SECTION 1. RESPONDENT'S BACKGROUND

INTRODUCTION AND INFORMED CONSENT

Namaste. My name is _____ and I am working with (NAME OF ORGANIZATION). We are conducting a national survey about the health of women, men, and children. We would very much appreciate your participation in this survey. Several different health-related topics will be discussed including use of health services, the quality of health care, marital and sexual relationships, and infectious diseases. This information will help the government to assess health and information needs and to better plan health services. The survey usually takes between 30 and 60 minutes to complete. Whatever information you provide will be kept strictly confidential and will not be shown to other persons.

Participation in this survey is voluntary and if you choose to participate, you may withdraw at any time. However, we hope that you will take part in this survey since your participation is important.

At this time, do you want to ask me anything about the survey?
ANSWER ANY QUESTIONS AND ADDRESS RESPONDENT'S CONCERNS.

In case you need more information about the survey, you may contact the person listed on the card that has already been given to you household.

May I begin the interview now?

Signature of interviewer: _____ Date: _____

1000	<p>CHECK FRONT COVER: WOMAN SELECTED FOR THIS SECTION?</p> <p align="center">YES <input type="checkbox"/></p> <p align="right">NO <input type="checkbox"/> → 1028</p>																														
1001	<p>CHECK FOR PRESENCE OF OTHERS: DO NOT CONTINUE UNTIL EFFECTIVE PRIVACY IS ENSURED.</p> <p>PRIVACY OBTAINED 1 PRIVACY NOT POSSIBLE 2 → 1027</p>																														
<p>READ TO THE RESPONDENT</p> <p>Now I would like to ask you questions about some other important aspects of a woman's life. I know that some of these questions are very personal. However, your answers are crucial for helping to understand the condition of women in India. Let me assure you that your answers are completely confidential and will not be told to anyone and no one else will know that you were asked these questions.</p>																															
1002	<p>CHECK 301 AND 308:</p> <p>CURRENTLY MARRIED <input type="checkbox"/> FORMERLY MARRIED <input type="checkbox"/> (1003 TO 1013: READ IN PAST TENSE)</p> <p>MARRIED MORE THAN ONCE <input type="checkbox"/> (1003 TO 1013: REFER TO CURRENT/LAST HUSBAND ONLY)</p> <p>NEVER MARRIED OR MARRIED, GAUNA NOT PERFORMED <input type="checkbox"/> → 1014</p>																														
1003	<p>First, I am going to ask you about some situations which happen to some women. Please tell me if these apply to your relationship with your (last) husband.</p> <p>a. He (is/was) jealous or angry if you (talk/talked) to other men.</p> <p>b. He frequently (accuses/accused) you of being unfaithful.</p> <p>c. He (does/did) not permit you to meet your female friends.</p> <p>d. He (tries/tried) to limit your contact with your family.</p> <p>e. He (insists/insisted) on knowing where you (are/were) at all times.</p> <p>f. He (does/did) not trust you with any money.</p>	<table border="0"> <tr> <td></td> <td align="center">YES</td> <td align="center">NO</td> <td align="center">DK</td> </tr> <tr> <td>JEALOUS</td> <td align="center">1</td> <td align="center">2</td> <td align="center">8</td> </tr> <tr> <td>ACCUSES</td> <td align="center">1</td> <td align="center">2</td> <td align="center">8</td> </tr> <tr> <td>NOT MEET FRIENDS</td> <td align="center">1</td> <td align="center">2</td> <td align="center">8</td> </tr> <tr> <td>NO FAMILY</td> <td align="center">1</td> <td align="center">2</td> <td align="center">8</td> </tr> <tr> <td>WHERE YOU ARE</td> <td align="center">1</td> <td align="center">2</td> <td align="center">8</td> </tr> <tr> <td>MONEY</td> <td align="center">1</td> <td align="center">2</td> <td align="center">8</td> </tr> </table>		YES	NO	DK	JEALOUS	1	2	8	ACCUSES	1	2	8	NOT MEET FRIENDS	1	2	8	NO FAMILY	1	2	8	WHERE YOU ARE	1	2	8	MONEY	1	2	8

SECTION 1. RESPONDENT'S BACKGROUND

INTRODUCTION AND INFORMED CONSENT

Namaste. My name is _____ and I am working with (NAME OF ORGANIZATION). We are conducting a national survey about the health of men, women and children. We would very much appreciate your participation in this survey. Several different health-related topics will be discussed including use of health services, the quality of health care, marital and sexual relationships, and infectious diseases. This information will help the government to assess health and information needs and to better plan health services. The survey usually takes about 30 minutes to complete. Whatever information you provide will be kept strictly confidential and will not be shown to other persons.

Participation in this survey is voluntary and if you choose to participate, you may withdraw at any time. However, we hope that you will take part in this survey since your participation is important.

At this time, do you want to ask me anything about the survey?

ANSWER ANY QUESTIONS AND ADDRESS RESPONDENT'S CONCERNS.

In case you need more information about the survey, you may contact the person listed on the card that has already been given to your household.

May I begin the interview now?

Signature of interviewer: _____ Date: _____

RESPONDENT AGREES TO BE INTERVIEWED 1 RESPONDENT DOES NOT AGREE TO BE INTERVIEWED 2 → END
