## INTRODUCTION

The 2005-06 National Family Health Survey (NFHS-3) is the third in the NFHS series of surveys. The first NFHS was conducted in 1992-93, and the second (NFHS-2) was conducted in 1998-99. All three NFHS surveys were conducted under the stewardship of the Ministry of Health and Family Welfare (MOHFW), Government of India. MOHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-3 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation, UNICEF, UNFPA, and the Government of India. Technical assistance for NFHS-3 was provided by Macro International, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute, Pune (NARI).

The survey provides trend data on key indicators and includes information on several new topics, such as HIV/AIDS-related behaviour, attitudes toward family life education for girls and boys, use of the Integrated Child Development Services (ICDS) programme, men's involvement in maternal care, and health insurance. For the first time, NFHS-3 provides information on men and unmarried women. In addition, NFHS-3 provides estimates of HIV prevalence for India as a whole based on blood samples collected in every state in the country, including Kerala. Separate HIV estimates are also provided for Andhra Pradesh, Karnataka, Maharashtra, Manipur, Tamil Nadu, and Uttar Pradesh.

In Kerala, the survey is based on a sample of 3,023 households that is representative at the state level and for urban and rural areas in the state. NFHS-3 interviewed 3,566 women age 15-49 from all the selected households and 1,121 men age $15-54$ from a subsample of households to obtain information on population, health, and nutrition in the state. The household response rate was 99 percent in the state as a whole and the individual response rates were 96 percent for eligible women and 90 percent for eligible men.

In addition to the interviews, height and weight measurements were taken for all children under age six years in the sample households and all interviewed women and men. Haemoglobin levels were measured for all interviewed women and men and for all children age 6-59 months. In a subsample of households, all interviewed women and men were eligible to have their blood collected for HIV testing. Biomarkers were measured only after obtaining informed consent. The NFHS-3 fieldwork in Kerala was conducted by the Population Research Centre, University of Kerala, Thiruvanathapuram from April 2006 to August 2006.

This report presents the key findings of the NFHS-3 survey in Kerala, followed by detailed tables and an appendix that provides sampling errors. More information about the definitions of indicators included in this report is contained in Volume I of the NFHS-3 National Report, and the questionnaires and details of the sampling procedure for NFHS-3 are contained in Volume II of the NFHS-3 National Report (available at www.nfhsindia.org).

## Household Characteristics

## Household composition

One-third (34\%) of Kerala's households are in urban areas, and the remaining two-thirds are in rural areas. On average, households in Kerala are comprised of four members. One-quarter of households are headed by women.

The majority of households in Kerala have household heads who are Hindu (60\%). About onefourth ( $23 \%$ ) of household heads are Muslim and one-sixth (17\%) are Christians. All other religions account for less than 1 percent of household heads.

The majority of Kerala's household heads ( $56 \%$ ) do not belong to the scheduled castes, scheduled tribes, or other backward classes. Thirty-one percent of household heads belong to other backward classes (OBC), 11 percent belong to a scheduled caste, and only 2 percent belong to a scheduled tribe.

About one-quarter of the population in Kerala (26\%) is under age 15; 8 percent of the population is age 65 and over.

Among children under 18 years of age, 2 percent have experienced the death of one or both parents. In all, 73 percent of children under 18 years of age live with both parents, 24 percent live with one parent, and 3 percent live with neither parent.

## Housing characteristics

Eighty-five percent of households in Kerala live in a рисса house. Ninety-one percent of households ( $89 \%$ of rural households and $95 \%$ of urban households) have electricity, up from 72 percent at the time of NFHS-2. Four percent of households have no toilet facilities, down from 15 percent at the time of NFHS-2. This proportion is low even in the rural areas of Kerala where only 5 percent of households do not have toilet facilities.

> In Kerala, more than two-thirds of households get their drinking water from wells, mainly from protected wells.

Sixty-nine percent of households use an improved source of drinking water (77\% of urban households and $65 \%$ of rural households), but only 13 percent have water piped into their dwelling, yard, or plot and 12 percent get drinking water from a public tap or standpipe. Most households in Kerala get their drinking water from a well: 40 percent get it from a protected well and 29 percent from an unprotected well (data not shown in tables). Eighty-three percent of households treat their drinking water to make it potable: 76 percent boil the water, 1 percent strain the water through a cloth, 3 percent use a ceramic, sand, or other water filter, and the remaining treat the water in some other way.

The majority of households in Kerala ( $72 \%$ ) use solid fuels for cooking, mainly wood and agricultural crop waste. Only 28 percent of households use clean fuels (LPG, natural gas, kerosene, or biogas) for cooking ( $42 \%$ in urban areas and $21 \%$ in rural areas).

## Wealth Index

The wealth index is constructed by combining information on 33 household assets and housing characteristics such as ownership of consumer items, type of dwelling, source of water, and availability of electricity into a single index. The household population is divided into five equal groups of 20 percent each (quintiles) at the national level from 1 (lowest, poorest) to 5 (highest, wealthiest). Since the quintiles of the wealth index are defined at the national level, the proportion of the population or households of a particular state that falls in any specific quintile will vary across states.

Based on the wealth index, Kerala is

Wealth Index
Percentage of households in urban and rural areas and percent distribution of households by wealth quintile
 wealthier than the nation as a whole. Forty-five percent of Kerala's households (55\% of urban households and $40 \%$ of rural househols) are in the highest wealth quintile. Only 6 percent of households in Kerala are in the lowest two wealth quintiles.

## EdUCATION

## Current school attendance among children

Almost all primary-school age children (6-10 years) attend school in Kerala (97\% in urban areas and $99 \%$ in rural areas). While school attendance among children age 11-14 years (97\%) is also almost universal, it is much lower, at 67 percent, for children age 15-17 years.

Among children age 6-10 years and 11-14 years, there is no gender disparity in school attendance in urban or rural areas. At age 15-17 years, girls are more likely than boys to be attending school, with the differential in favour of girls being greater in rural areas ( 7 percentage points) than in urban areas (1 percentage point).

## Literacy and educational attainment

In NFHS-3, literate persons are those who have either completed at least standard six or 'passed' a simple literacy test conducted as part of the survey. According to this measure, 93 percent of women and 96 percent of men age 15-49 are literate in Kerala.

Only 4 percent of women and 1 percent of men age 15-49 have never attended school. Nonetheless educational attainment remains low in Kerala. Less than half of women and men (about 48-49\%) have completed 10 or more years of education.

## Attitudes toward family life education in school

Virtually all women and men in Kerala agree that children should be taught moral values in school. Most adults $(85-90 \%)$ also think that children should learn about the changes in their own bodies during puberty, but fewer adults (55-70\%) think that children should learn about puberty-related changes in the bodies of the opposite sex.

Men and women differ somewhat on whether they think that children should be taught in school about contraception. More than half of women (55\%) and more than two-thirds (69\%) of men think girls should learn about contraception. Both women and men are slightly less likely $(42 \%$ and $62 \%$, respectively) to think that contraception should be part of boys' school education.

Most men (92-93\%) and most women ( $86 \%$ ) believe that information on HIV/AIDS should be part of the school curriculum. About 70 percent of men feel that both boys and girls should be taught about sex and sexual behaviour in school, but fewer women ( $55-61 \%$ ) feel that this is an appropriate topic for school children. Similarly almost three-fourths of men believe that boys and girls should be taught about condom use to avoid sexually transmitted diseases, compared with about half of women (52-55\%).

## Fertility

## Age at first marriage

The median age at first marriage among women age 25-49 in Kerala is 21 years, one of the highest in the country. Men age 30-49 get married about 8 years later, at median ages of 28-29 years. About one-sixth of women ( $15 \%$ ) age 20-24 years got married before the legal minimum age of 18 and only 3 percent of men age 25-29 years got married before the legal minimum age of 21 .

## Fertility levels

At current fertility levels, a woman in Kerala will have an average of 1.9 children in her lifetime. Fertility in Kerala is lower than in any other state except Andhra Pradesh, Goa, and Tamil Nadu, where the fertility rate is 1.8 children per woman. Fertility in rural Kerala, at 2.0 children, is 0.3 children higher than in urban Kerala where the fertility is 1.7 children. Notably, fertility even in the rural areas of Kerala is already below the replacement level of 2.1 children.

Kerala had achieved replacement level fertility even at the time of NFHS-1, almost 13 years before NFHS-3. Between NFHS-1 and NFHS-3, fertility has declined further marginally by 0.07 children. In keeping with the low fertility in Kerala, only 6 percent of births in the three years preceding NFHS-3 were of order four or higher.

Despite the overall low level of fertility in Kerala, there are notable differentials by caste/tribe and by religion. By caste/tribe,

Fertility Trends
Total fertility rate
(children per woman)
 the fertility rate for women who do not belong to the scheduled castes, scheduled tribes, or other backward classes, at 2.2 children, is higher than for women belonging to the scheduled castes and to other backward classes (1.31.7 children).

Kerala had achieved replacement level fertility in both urban and rural areas even at the time of NFHS-1, about 13 years before NFHS-3.

## Total Fertility Rate by State

Children per woman

Even larger differentials are observed by religion. At current fertility rates, Muslim women will have about one child more than Hindu women (a TFR of 2.5, compared with 1.5). In Kerala, fertility varies little by education and wealth.

## How does fertility vary with education and household wealth? <br> Total fertility rate (children per woman)

Note: Categories with fewer than 125 unweighted woman-years of exposure are not shown.

## Teenage pregnancy

Among young women age 15-19, only 6 percent have begun childbearing, which is much less than the national average of 16 percent. Few women age 15-16 have started childbearing, but by age 19, 16 percent of women are either mothers already or are pregnant. These statistics reflect the later age at marriage of women in Kerala than in the country as a whole.

## Birth intervals

The median interval between births in Kerala is 41 months, 10 months longer than the national average. Nineteen percent of births occur within 24 months of the previous birth including 6 percent that occur within 24 months of a previous birth. About 4 out of $10(39 \%)$ births occur within three years. Research shows that waiting at least three years between children reduces the risk of infant mortality.

## Fertility preferences

Sixty-nine percent of women and 65 percent of men in Kerala want no more children, are already sterilized, or have a spouse who is sterilized. Among those who do want another child, 47 percent of both women and men would like to wait at least two years. More than twothirds of women ( $69 \%$ ) and three-fourths of men consider the ideal family size to be two children or less.

Many Indians show a strong preference for sons but son preference is low in Kerala. While only 11-12 percent of women and men want more sons than daughters, fewer, 4-6 percent, want more daughters than sons. However, the majority of men and women would like to have at least one son and a majority would also like at least one daughter.

In keeping with very low son preference, the desire for more children is affected only marginally by women's number of sons. For example, among women with two children, those with one or two sons ( $88-91 \%$ ) are somewhat more likely to want no more children than those with two daughters (86\%). Notably, the proportion of currently married women with two children who want no more children (irrespective of their number of sons) has been steadily rising in Kerala, from 84 percent in NFHS-1 to 88 percent in NFHS-3.

Unplanned pregnancies are relatively uncommon in Kerala. If all women in

How does son preference affect women's desire for children?
Percentage of currently married women with two children who want no more children
-NFHS-1 -NFHS-2 -NFHS-3

2 boys and no girls 1 boy and 1 girl 2 girls and no boys
Current family size

Kerala were to have only the number of children they wanted, the total fertility rate would be only slightly lower - 1.8 children - instead of 1.9 children.

## Family Planning

## Knowledge of family planning methods

Knowledge of contraception is almost universal in Kerala. Female sterilization is the most

How many women know about
family planning?
Percentage of currently married women
 widely known method by currently married women and condom is the most widely known method by men, closely followed by female sterilization. Seventy-four percent of women and 87 percent of men know about male sterilization. The government family planning programme promotes three temporary methods: the pill, the IUD, and condoms. Almost 9 in 10 currently married women know each of these methods; currently married men are much more likely to know about condoms ( $97 \%$ ) than the pill or IUD (8486\%).

Knowledge of female sterilization among currently married women remained constant between NFHS-1 and NFHS-2, but decreased slightly (by 2 percentage points) between NFHS-2 and NFHS-3. Knowledge of each of the three modern temporary contraceptive methods promoted by the government has also decreased slightly between NFHS-2 and

NFHS-3. For example, knowledge of condoms has declined from 92 percent in NFHS-2 to 88 percent in NFHS-3. The largest decrease is in knowledge of male sterilization, however. Among currently married women, the percentage who know about male sterilization fell from 94 percent in NFHS-2 to 74 percent in NFHS-3.

## Contraceptive use

The contraceptive prevalence rate among currently married women is 69 percent, up from 64 percent in NFHS-2 and 63 percent in NFHS-1. Most of the increase in the contraceptive prevalence rate between NFHS-2 and NFHS-3 is due to slight increases in the use of the IUD, the condom, and traditional methods. Female sterilization which accouted for 76 percent of contraceptive use in NFHS-2, now accounts for 71 percent. The use of male sterilization has more than halved since NFHS-2.

How many women use family planning?
Percentage of currently married women

Any method

Contraceptive Prevalence Rate by State
Percentage of currently married women

Kerala has the
third highest contraceptive prevalence rate among all the states in India.

Contraceptive use increases sharply with age from 20 percent among women age 15-19 to 81 percent among women age 40-49. The contraceptive prevalence rate is the same in both urban and rural areas. Muslim women are much less likely to use a contraceptive method (55\%) than are Christian or Hindu women (74-75\%). Contraceptive use is higher among women with less than 5 years of education, employed women, and women belonging to the scheduled castes than other women. Women from the highest wealth quintile are less likely to use family planning methods than women in lower wealth quintiles.

The use of contraception among women in Kerala varies little by women's number of sons. For example, 85 percent of women with two sons but no daughters use a method of family planning, compared with 87 percent of women with two daughters but no sons (not all data shown in tables).

The most commonly used modern spacing method is the condom, which is used by 6 percent of currently married women. Only 2 percent of currently married women use the IUD and less than 1 percent use the pill. Five percent of currently married women use the rhythm method and 6 percent use withdrawal. These two traditional methods together are used by more women than are all modern temporary methods taken together.

In general, female sterilization is used more by poorer, less educated, scheduled- caste, and Hindu women, whereas spacing methods, both modern and traditonal, are used more by better-educated, urban, and wealthier women. Notably, almost one in

What contraceptive methods do women use? Currently married women

five Christian women use a traditional method, higher than any other group of women.
Contraceptive use at last sex as reported by men is lower than women's reports of current contraceptive use. Fifty-seven percent of currently married men report using contraception the last time they had sex. Men are more likely than women to report current use of condoms, however.

Sixty-seven percent of sterilized women had the operation in a government facility, usually in a government or municipal hospital and about half of IUD users (52\%) had their IUD insertion in a public medical sector facility. The majority of condom users obtained their method from the private medical sector. However, almost one-sixth of condom users did not give a source; instead they said that they had obtained the condom from their husband. According to women's reports, 17 percent of condom users for whom the brand was known, use social marketing brands.

The one-year discontinuation rate for family planning in Kerala, at 36 percent, is higher than the national average ( $27 \%$ ). The discontinuation rate is highest for condoms: 61 percent of condom users discontinued use within the first year after they adopted the method. More than 4 out of 10 users of traditional methods ( $44 \%$ users of the rhythm method and $40 \%$ users of withdrawal) discontinued use within the first year of use.

## Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method they prefer. However, only 44 percent of modern contraceptive users were told about the side effects of their method when they started using it and about one-third ( $34 \%$ ) each were told what to do if side effects occurred and about other methods they could use by a health or family planning worker.

## Men's attitudes

Most men $(83 \%)$ in Kerala reject the idea that contraception is women's business and a man should not have to worry about it and reject the idea that women using contraception may become promiscuous ( $91 \%$ ). However, 45 percent of men incorrectly believe that women who are breastfeeding cannot become pregnant. Sixty-two percent of men know that a condom, if used correctly, protects against pregnancy most of the time.

## Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely but are not using contraception. According to this definition, 9 percent of married women in Kerala have an unmet need for family planning, down from 12 percent in NFHS-1 and NFHS-2. Currently, 89 percent of the demand for family planning is being met, up from 84 percent in NFHS-1 and NFHS-2.

## Infant and Child Mortality

The infant mortality rate in Kerala has been steadily decreasing over time. Infant mortality is currently estimated at 15 deaths before the age of one year per 1,000 live births, down from the NFHS-2 estimate of 16 deaths and the NFHS-1 estimate of 24 . Under-five mortality in Kerala is 16 deaths per 1,000 .

Kerala, along with Goa, has the lowest infant mortality rate of any state in the country.

In Kerala, the infant mortality rate for boys is higher than for girls. Boys also have a higher under-five mortality rate than girls, despite

Deaths per 1,000 live births the fact that the child mortality rate, which measures the probability of dying between the first and fifth birthdays, is marginally higher for girls than for boys.

Children whose mothers have less than 10 years of education are more than twice as likely to die before their first birthday as children whose mothers have completed at least 10 years of school. The infant mortality rate declines sharply with household wealth and is lower for women who belong to other backward classes than for women who do not belong to the scheduled castes, scheduled tribes, or other backward classes. Infant mortality in Kerala does not vary by religion.

Infant Mortality Rate by State
Deaths per 1,000 live births

## Perinatal Mortality

Perinatal mortality, which includes stillbirths and very early infant deaths (in the first week of life), is estimated at 11 deaths per 1,000 pregnancies that lasted 7 months or more. Perinatal mortality in rural areas, at 15, is much higher than the rate in urban areas (9) (data for perinatal mortality are not shown in the tables).

Kerala has the lowest perinatal mortality rate than any other state in India.

## Maternal Health

## Antenatal care

Almost all women who gave birth in the five years preceding the survey received antenatal care from a health professional, including 98 percent from a doctor and 1 percent from all other health personnel. One percent of women received antenatal care from a traditional birth attendant or ICDS worker. The proportion of women who received antenatal care does not vary by women's background characteristics.

> Almost all women in Kerala with a birth in the past five years received antenatal care from a doctor.

Ninety-two percent of women received antenatal care during the first trimester of pregnancy, as is recommended. Another 6 percent had their first visit during the fourth or fifth month of pregnancy (data not shown in tables). Ninety-four percent of women had three or more antenatal care visits for their most recent live birth in the past five years; urban women were slightly more likely to have three or more visits than women in rural areas.

## Three or More Antenatal Care Visits by State

Percentage of last births in the past five years

Kerala ranks below Tamil
Nadu and Goa in
its coverage of three or more antenatal care visits.

Among women with births in the three years preceding the survey, the proportion who received three or more antenatal care visits for their last birth decreased by almost 5 percentage points between NFHS-2 and NFHS-3, although this proportion had risen between NFHS-1 and NFHS-2. However, the proportion who received antenatal care during their first trimester of pregnancy increased substantially, by 11 percentage points, between NFHS-2 and NFHS-3.

For 96 percent of their last births, women received iron and folic acid supplements (IFA) during pregnancy, but only 75 percent
 consumed IFA for the recommended 90 days or more. Almost 9 in 10 women received two or more doses of tetanus toxoid vaccine. Only 10 percent of women took a deworming drug during pregnancy.

In Kerala, almost all women who received antenatal care, received most of the services needed to monitor their pregnancy. Ninety-six percent of women who received antenatal care had their weight taken, and 99 percent each had their abdomen examined, blood pressure measured, and blood and urine samples taken.

An ultrasound test was performed during 76 percent of pregnancies in the five years preceding the survey. The proportion of pregnancies with an ultrasound is more than three times the national average of 24 percent. More than 8 out of 10 pregnancies to women with 10 or more years of education, women in urban areas, Christian women, women who had four or more antenatal care visits, and women in the highest wealth quintile had ultrasound tests during their pregnancies in the past five years.

## Delivery care

Almost all births in the five years preceding the survey took place in a health facility (99\%); only 1 percent took place at home. Sixty-four percent of births took place in a private health facility, compared with 36 percent in a public health facility. Ninety-nine percent of births in the past five years were delivered with assistance from a health professional.

Among births in the three years preceding the survey the proportion that took place in a health facility has risen steadily from 89 percent in NFHS-1 and 93 percent in NFHS-2, to 100

Percentage of births in the past three years

Assisted by a health professional
percent in NFHS-3. Similarly, the proportion of births delivered with the help of a health professional has also increased to 100 percent in NFHS-3 from 91 percent in NFHS-1 and 94 percent in NFHS-2.

## Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. Although almost all births in Kerala took place in a health institution, only 87 percent of mothers had a postnatal check-up after their last birth and 85 percent had a postnatal checkup within two days of birth, as is recommended.

## Male involvement in maternal care

Ninety-one percent of men with a child under three years of age said they were present during at least one antenatal check-up received by the child's mother; however, only 52 percent were told by a health provider or health worker what to do if the mother had a major pregnancy complication, and 26-48 percent were told about specific signs of pregnancy complication.

The majority of fathers in Kerala with a child less than three years of age were provided information related to maternal care. Eighty-five percent were told about the importance of proper nutrition for the mother during pregnancy and 61 percent were told about the importance of delivering the baby in a health facility.

## Institutional Delivery by State

Percentage of births in the past five years

## Child Health

## Vaccination of children

Three-quarters of children age 12-23 months in Kerala are fully vaccinated against six major childhood illnesses: tuberculosis, diphtheria, pertussis, tetanus, polio, and measles. Only 2 percent of children have received no vaccinations at all.

Ninety-six percent of children have received a BCG vaccination; however, only 82-84 percent have received each of the recommended three doses of the DPT and polio vaccines and the measles vaccine.

## About one in six children age 12-23 months in Kerala have not received the recommended three doses of the polio vaccine.

The DPT and polio vaccines are given in a series. Many children receive the first dose but do not finish the series. Between the first and third doses, the dropout rate is 11 percent for the DPT vaccine and 12 percent for the polio vaccine. Despite the nationwide attempt to eradicate polio, 17 percent of children age 12-23 months in Kerala have not received the recommended three does of the polio vaccine.

## Full Immunization Coverage by State

Percentage of children 12-23 months

Although Kerala ranks third among all states in full immunization coverage, one-fourth of children age 12-23 months in Kerala have not received all<br>the recommended<br>vaccinations.

In Kerala, there has been a decrease in full vaccination coverage from 80 percent in NFHS-2 to 75 percent in NFHS-3. The decline in full immunization coverage has been accompanied by a decrease in the coverage of almost all vaccines. For example, the coverage of three doses of the polio vaccine decreased by 5 percentage points, three doses of the DPT vaccine decreased by 4 percentage points, and the measles vaccine decreased by 3 percentage points.

Children in urban areas, children of educated mothers, children in wealthier households, and children belonging to other backward classes are more likely than other children to receive all vaccinations. Girls are slightly more likely to be fully vaccinated than boys.

## Childhood illnesses

In the two weeks before the survey, 3 percent of children under age five years had symptoms of an acute respiratory infection (cough and short, rapid breathing that was chest-related and not due to a blocked or runny nose). Of these children, 89 percent were taken to a health facility or health provider and one-third received antibiotic drugs.

Twenty-three percent of children under age five years were reported to have had fever in the two weeks preceding the survey; 81 percent of these children were taken to a health facility or provider for treatment, and only 1 percent received antimalarial drugs.

Overall, 7 percent of children had diarrhoea in the two weeks preceding the survey. Among these children, less than two-thirds ( $63 \%$ ) were taken to a health care provider. More than 8 out of 10 children $(81 \%)$ were treated with some kind of oral rehydration therapy (ORT), including 32 percent who were treated with a solution prepared from oral rehydration salt (ORS) packets and 78 percent who were given gruel. Ten percent of children with diarrhoea did not receive any type of treatment at all. Thirteen percent received antibiotics, which are not normally recommended for treating childhood diarrhoea.

The use of ORS remains low in Kerala even though the vast majority of women (92\%) who had a child in the five years preceding the survey know about ORS packets.

Children should receive more fluids than usual during diarrhoeal illness, but in Kerala less than half $(44 \%)$ received more liquids than normal. About one-fifth $(19 \%)$ of children with diarrhoea received less to drink than normal, which can increase the risk of dehydration.

## Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based anganwadi centres. Among the 90 percent of children under six years in Kerala who are in areas covered by an anganwadi centre, thirty-one percent receive services of some kind from the centre.

The most common services that children age 0-71 months in areas covered by anganwadi centre received are supplementary food (25\%) and health check-ups (18\%); 31 percent of children age 36-71 months received early childhood care/preschool services. About one-fifth of

## How many children receive anganwadi centre

 services?Percentage of age-eligible children in areas covered by an anganwadi centre receiving services

children under five years received growth monitoring services. Only 9 percent of children receive vaccinations at the anganzwadi centre.

Children who are 3-5 years old are more likely to receive services from an anganwadi centre than are younger or older children. Children belonging to the scheduled castes and children from the lower wealth quintiles are more likely than most other children to take advantage of the services offered at anganwadi centres.

Among children under age six years in areas covered by an anganwadi centre, only 18 percent had mothers who received any service during pregnancy, and even fewer ( $11 \%$ ) had mothers who received any service when breastfeeding.

## Breastfeeding, Nutrition, and Anaemia

## Infant feeding

Although breastfeeding is nearly universal in Kerala, only 56 percent of children under six months of age are exclusively breastfed, as the World Health Organization (WHO) recommends. Ninety-six percent of children are put to the breast within the first day of life, including 57 percent who started breastfeeding in the first hour of life, which means that only 4 percent of infants are deprived of the highly nutritious first milk (colostrum) and the antibodies it contains. Mothers in Kerala breastfeed for an average of 25 months, one month longer than the minimum of 24 months recommended by WHO for most children.

It is recommended that nothing be given to children other than breast milk in the first three days when the milk has not begun to flow regularly. However, 11 percent of children are given something other than breast milk during that period.

WHO offers three recommendations for infant and young child feeding (IYCF) practices for children 6-23 months old: continued breastfeeding or feeding with appropriate calcium-rich foods if not breastfed; feeding solid or semi-solid food for a minimum number of times per day according to age and breastfeeding status; and, including foods from a minimum number of food groups per day according to breastfeeding status. In Kerala, about 4 out of 5 children (79\%) age 6-23 months are fed the recommended minimum times per day and about threequarters $(74 \%)$ are fed from the minimum number of food groups. However, only 61 percent are fed according to all three recommended practices.

Vitamin A deficiency can cause eye damage and a higher risk of dying from measles, diarrhoea, or malaria. The Government of India recommends that children under three years receive vitamin A supplements every six months, starting at age 9 months. Although more than three-quarters ( $78 \%$ ) of last-born children age 6-35 months ate vitamin A-rich foods during the day or night before the interview, less than half ( $47 \%$ ) of children age $12-35$ months were given a vitamin A supplement in the past six months.

Eating foods rich in iron and taking iron supplements can prevent anaemia. Six out of ten lastborn children age 6-35 months ate iron-rich foods during the day or night before the interview, and only 6 percent of children age 6-59 months were given iron supplements in the week before the interview.

## Children's nutritional status

One-quarter of children under age five are stunted, or too short for their age, which indicates that they have been undernourished for some time. About one in six ( $16 \%$ ) are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness. Twenty-three percent

Trends in Children's Nutritional Status
Percentage of children under three years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population are underweight, which takes into account both chronic and acute undernutrition.

Even during the first six months of life, when most babies are breastfed, 14-16 percent of children are stunted or underweight and 24 percent are wasted. Children in rural areas are more likely to be undernourished, but even in urban areas, 22 percent of children suffer from chronic undernutrition. Boys are slightly more likely to be undernourished according to each of these three measures than girls.

Children's nutritional status in Kerala has improved slightly since NFHS-2 by some measures but not by all measures. Children under age three years (the age group for which nutritional status data are available in NFHS-2) are slightly less likely to be stunted (by 2 percentage point) and underweight (by 1 percentage point), but they are slightly more likely to be wasted (by 3 percentage points) today than they were seven years ago.

## Adults' nutritional status

Adults age 15-49 years in Kerala suffer from a dual burden of malnutrition; about one-fifth of adults are too thin ( $18 \%$ of women and $22 \%$ of men), and more than one-quarter of women ( $28 \%$ ) and 18 percent of men are overweight or obese. Only 54 percent of women and 61 percent of men are at a healthy weight for their height. Undernutrition among ever-married women has declined in the past seven years from 19 percent in NFHS-2 to 13 percent in NFHS-3.

Undernutrition is more common in rural areas, among teenagers, among never married, among the scheduled castes and the less wealthy. Overweight and obesity are most common in older adults, those in urban areas, and those in the highest wealth quintile. Because population groups that are less likely to be too thin are the same groups that are more likely to be overweight or obese, the percentage suffering from either of these two nutritional problems tends to be fairly constant across all groups, regardless of most background characteristics.

Using iodized salt prevents iodine
 deficiency, which can lead to miscarriage, goitre, and mental retardation. About three-quarters of households in Kerala ( $74 \%$ ) were using sufficiently iodized salt at the time of the survey. This is much higher than the percentage observed during NFHS-2 (39\%). A nationwide ban on non-iodized salt took effect just as the NFHS-3 fieldwork was being completed, so the effects of the new law could not be determined by the survey.

## Anaemia

Anaemia is a major health problem in Kerala, especially among women and children. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Among children between the ages of 6 and 59 months, 45 percent, are anaemic. This includes 24 percent who are mildly anaemic, 21 percent who are moderately anaemic, and 1 percent who suffer from severe anaemia. Boys and girls are equally likely to have anaemia.

Children of mothers who are anaemic are much more likely to have anaemia. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. At least two in five children are anaemic even if their mother has 10 or more years of education or is in the highest wealth quintile.

Anaemia among women, men, and children

One-third of women in Kerala are anaemic, including 26 percent with mild anaemia, 7 percent with moderate anaemia, and 1 percent with severe anaemia. Anaemia is particularly high for women with no education, and women from the scheduled tribes. Women who are pregnant are slightly more likely to have anaemia than non-pregnant women.

Anaemia is more widespread among both women and children than it was seven years ago at the time of NFHS-2. Among children age 6-35 months, the prevalence of anaemia has risen by 12 percentage points from 44 percent in NFHS-2. Similarly, among evermarried women, the prevalence of anaemia is 10 percentage points higher in NFHS-3 (33\%) than it was in NFHS-2 (23\%).

About one in twelve men age 15-49 (8\%) in Kerala are anaemic, with men under age 20 years being more likely to suffer from anaemia than older men. Men belonging to the scheduledcastes and to the other backward classes and men with less than five years of schooling are more likely to be anaemic than other men.

## HIV/AIDS

## Awareness of AIDS

Ninety-five percent of women in Kerala have heard of AIDS (97\% in urban areas and 94\% in rural areas). More women know about AIDS now than in the late 1990s. Among ever-married women, 87 percent knew about AIDS in NFHS-2, compared with 95 percent in NFHS-3.

Almost all men age 15-49 in Kerala have heard of AIDS (99\% in urban areas and $98 \%$ in rural areas).

## Knowledge of prevention and transmission

Although similar proportions of men and women have heard of AIDS in Kerala, men are much more likely than women to know how HIV is transmitted and how to keep from getting it. For example, 82 percent of men, but only 65 percent of women, know that consistent use of condoms helps prevent HIV/AIDS and 91 percent of men, but only 79 percent of women, know that having just one uninfected, faithful partner can reduce the chance of getting HIV/AIDS.
Only 33 percent of women and 41 percent of men have a 'comprehensive knowledge' of HIV/AIDS. This means they know that a healthy-looking person can have HIV/AIDS, that HIV/AIDS cannot be transmitted through mosquito bites or by sharing food, and that condom use and having only one uninfected, faithful partner can help prevent HIV/AIDS.

## HIV-related stigma

Sixty-two percent of women and 78 percent of men in Kerala would be willing to take care of a family member with HIV/AIDS in their home. More than three-quarters of women (77\%) and 83 percent of men say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Fifty-eight percent of women and two-thirds of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Sixty-two percent of women and 53 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret. Overall however, only 29 percent of women and 33 percent of men express accepting attitudes on all four of these indicators.

## HIV testing prior to NFHS-3, blood transfusions, and safe injections

Ten percent of women and men age 15-49 in Kerala had ever been tested for HIV prior to NFHS-3. In Kerala, a higher proportion of women ( $6 \%$ ) than men ( $3 \%$ ) have ever had a blood transfusion. However, men are more likely than women ( $36 \%$ of men, compared with $27 \%$ of women) to have received an injection from a health worker in the past year.

For at least 9 out of 10 women and men who received an injection from a health worker in the past 12 months, the last injection was 'safe', i.e., the syringe and needle were taken from a newly opened package or the needle used had been sterilized.

## HIV prevalence

In Kerala, blood was collected for HIV testing from eligible women and men in a subsample of households. The results of the HIV testing of blood samples collected from Kerala contributed to the national HIV prevalence estimate. However, no separate estimate of HIV prevalence is available for Kerala. Nationally, 0.28 percent of adults age $15-49$ are infected with HIV, including 0.35 percent in urban areas and 0.25 percent in rural areas. If the six states considered by the National AIDS Control Organization as having high HIV prevalence are excluded, the HIV prevalence for the remaining 23 states combined, including Kerala, is 0.08 percent among women age 15-49 and 0.16 percent among men age 15-49 (data not shown in tables).

## Sexual Behaviour

NFHS-3 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, and condom use. Additionally, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

## Age at first sexual intercourse

More than half of women in Kerala have had sexual intercourse by the time they are 21 years of age; however, first sexual intercourse for half of the men age $30-49$ years occurs only by the time they are 28-29 years.

Among youth 15-24 years of age, women are much more likely than men to have ever had sex: 34 percent of women and only 7 percent of men in this age group have ever had sex. The earlier age at sexual intercourse for women than men is a consequence of the fact that first sexual intercourse largely occurs within marriage and women marry at younger ages than men.

## Higher-risk sex and multiple sex partners

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past year, only 0.1 percent of women and 4 percent of men reported having had high-risk sex during the year. One percent of male respondents said they had multiple sex partners in the past year, but insignificant numbers of female respondents reported having multiple partners.

## Paid sex

One percent of men age 15-49 in Kerala said they had paid for sex in the past year.

## Adult Health and Health Care

## Tuberculosis

In Kerala, 268 persons per 100,000 are estimated to have medically treated tuberculosis based on reports from household respondents. The prevalence of tuberculosis is higher among men (340) than among women (203). Prevalence increases with age and is higher in households that use solid fuels for cooking than households that use other types of cooking fuels.

Most respondents have heard of tuberculosis ( $94 \%$ of women and $96 \%$ of men). Among people who have heard of tuberculosis, a higher proportion of women (74\%) than men (64\%) know that it can be spread through the air by coughing or sneezing; however, 35 percent of women, but fewer men ( $27 \%$ ) have misconceptions about how tuberculosis is spread. Most women and men know that tuberculosis can be cured ( $79 \%$ of women and $78 \%$ of men) and only 12 percent of women and 11 percent of men say that if a family member had tuberculosis, they would want to keep it a secret from the neighbours.

## Diabetes, asthma, and goitre

According to self reports, about 3 percent of women and men age 15-49 suffer from diabetes. The prevalence of diabetes in the age group 35-49 is 6 percent for women and 7 percent for men.

About 4 percent of women and 3 percent of men suffer from asthma. The prevalence of goitre or other thyroid disorders is substantially higher for women than for men $(5,744$ per 100,000 women, compared with 1,888 per 100,000 men).

## Tobacco and alcohol use

More than 4 out of 10 men ( $44 \%$ ) and 2 percent of women use some form of tobacco. One percent of pregnant women and 1 percent of breastfeeding mothers use tobacco (data not shown in tables). Women who use tobacco are most likely to chew tobacco in the form of paan masala, ghutka, or other tobacco; whereas men who use tobacco are most likely to be smoking cigarettes or bidis. Tobacco use is more common in rural areas than in urban areas.

Alcohol use among men is about as common as tobacco use. Forty-five percent of men and 1 percent of women in Kerala drink alcohol. Thirty-nine percent of men who drink alcohol consume it at least once a week.

## Source of health care

Households in Kerala are about equally divided into those that use the public medical sector and those that use the private medical sector as the main source of health care. However, rural households ( $52 \%$ ) are somewhat more likely to use the public medical sector than urban households ( $46 \%$ ) and wealthier households are less likely to use the public medical sector than households in the lower wealth quintiles.

Among households that do not use government health facilities, the main reasons given for not doing so are lack of a nearby facility ( $48 \%$ ), poor quality of care ( $34 \%$ ), long waiting times $(26 \%)$, and timing not convenient ( $21 \%$ ) (data not shown in tables).

## Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, only 9 percent of households in Kerala report that they have any kind of health insurance that covers at least one member of the household. Two types of programmes dominate: private commercial health insurance schemes and medical reimbursement from the employer. Other common forms of coverage are the Employee State Insurance Scheme (ESIS) and the Central Government Health Scheme (CGHS). Coverage is higher in urban areas than in rural areas and increases with the wealth status of the household.

## Women's Empowerment

## Employment and earnings

Only 29 percent of currently married women age 15-49 in Kerala were employed in the past year, compared with 99 percent of currently married men. Eighteen percent of employed women work in agriculture, compared with 14 percent of employed men. About 9 out of 10 employed women were paid only in cash, 4 percent were paid in cash and in kind, and 1 percent were paid only in kind. Seven percent of employed women were not paid for their work. Overall, among the currently married, 91 percent of employed women earn cash, compared with 98 percent of employed men.

Among married women who work and are paid in cash, a great majority ( $90 \%$ ) decide how their earnings will be spent, either alone or together with their husbands. More than one in five employed currently married women who earn cash earn about the same or more than their husbands.

## Decision making

Married women were asked who makes decisions on their own health care, making large household purchases, making purchases for daily household needs, and visiting their own family or relatives. In Kerala, 62-78 percent of currently married women participate in making each of these decisions. However, only 47 percent participate in making all four of these decisions. Participation in all four decisions increases sharply with age. Women in nuclear households, women who are employed for cash, women in urban areas, and Christian women are more likely than most other women to participate in all four of these decisions.

## Other indicators of women's empowerment

Only 21 percent of women age 15-49 have some money that they can decide how to use. Women who are employed for cash are much more likely than any other women to have money that they can decide how to use. The proportion of women with money which they control is also higher for women who are widowed, divorced, separated, or deserted, women with at least 10 years of education, women in the highest wealth quintile, urban women, and Christian women.

More than one-quarter of women (27\%) have a bank or savings account that they themselves use, higher than the national average (15\%). More than four-fifths of women (83\%) know about a microcredit programme in their area, but only 8 percent have ever used a microcredit program.

More than half the women in Kerala are allowed to go by themselves to the market (52\%) or to a health facility $(54 \%)$ but less than half $(41 \%)$ have freedom to travel alone outside their own village or community (data not shown in tables). However, only 35 percent are allowed to go alone to all three places. Older women, women who are employed for cash, women who are widowed, divorced, separated, or deserted, Christian women, women belonging to the scheduled castes, and women in nuclear households have more freedom of movement than most other women.

## Gender-role attitudes

Two-thirds of women in Kerala ( $66 \%$ ) believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to agree that wife-beating is justified if a woman shows disrespect for her in-laws (45\%) or if she neglects the house or children (44\%). Men in Kerala are only somewhat less likely than women to agree with wife beating: 54 percent say wife beating is justified in some circumstances, including 37 percent who believe that disrespect for in-laws and 34 percent who believe that neglecting the house or children are justifications for wife beating. Agreement with wife beating for one or more reasons varies little by background characteristics for both women and men.

Fifty-nine percent of women and two-thirds of men in Kerala believe that a woman is justified in refusing to have sex with her husband in all three of the following circumstances: if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, or if she is tired or not in the mood.

## Domestic Violence

Among women age 15-49, 16 percent have ever experienced physical violence and 5 percent have ever experienced sexual violence. In all, 17 percent of women in Kerala have experienced physical or sexual violence, including 19 percent of ever-married women.

## Spousal violence

One in seven ever-married women report having been slapped by their husbands; 4-7 percent report having been pushed, shaken, or having something thrown at them; having their arms twisted or their hair pulled; being kicked, dragged, or beaten up; or being punched with the fist or with something that could hurt her. One percent each report that their husband tried to choke or burn them on purpose and threatened or attacked them with a weapon.

Spousal Physical or Sexual Violence by State
Percentage of ever-married women

Almost one-sixth of ever-married women in Kerala have ever experienced physical or sexual spousal violence by their current or most recent husbands.

Four percent of ever-married women report that their husbands have physically forced them to have sex and 2 percent report that their husbands forced them to perform sexual acts that they did not want to perform. Ten percent have experienced emotional violence committed by their husbands. An insignificant proportion of women in Kerala have ever initiated violence against their husbands.

Overall, 16 percent of ever-married women have experienced physical or sexual violence from their current husband or, if not currently married, their most recent husband. Spousal physical or sexual violence declines sharply with education, from 26-28 percent among women with no or little education to 10 percent among women with 10 or more years of education. Employed women are twice as likely as women who are not employed to report having experienced violence. Women whose mothers were beaten by their fathers are more than two and a half times as likely as women whose mothers were not beaten to be in abusive marriages themselves. Sixty-four percent of women whose husbands often get drunk report experiencing violence, compared with 10 percent of women whose husbands do not drink any alcohol.

More than one-third ( $34 \%$ ) of ever-married women who experienced spousal physical or sexual violence have suffered physical injuries as a result of spousal violence. For most women who have ever experienced spousal violence, the violence first occurred within the first 1-2 years of their marriage (data not shown in tables).

## Help seeking

Only 36 percent of women who have ever experienced violence have sought help to end the violence. About half of women ( $46 \%$ ) have neither sought help nor told anyone about the violence. Abused women most often seek help from their own families. Very few women seek help from any institutional source, such as the police or social service organizations.

## Table 1 Results of the household and individual interviews

Number of households, number of interviews with women and men, and response rates, according to residence, Kerala, 2005-06

| Number of users | 1,341 | 30 | 60 | 145 | 1,586 |

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status.
CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; NGO = Nongovernmental organization
( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Includes users of pill and injectables, who are not shown separately.

## Table 25 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the five years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, and the percentage who were informed about other methods they could use, by method and initial source of method, Kerala, 2005-06

| Method/source | Percentage who were informed about side effects or problems of method used | Percentage who were informed about what to do if experienced side effects | Percentage who were informed by a health or family planning worker about other methods that could be used | Number of women |
| :---: | :---: | :---: | :---: | :---: |
| Method |  |  |  |  |
| Female sterilization ${ }^{1}$ | 42.1 | 30.9 | 31.9 | 285 |
| Pill | * | * | * | 9 |
| IUD | 58.0 | 54.0 | 41.9 | 50 |
| Initial source of method ${ }^{2}$ |  |  |  |  |
| Public medical sector | 44.8 | 33.9 | 33.4 | 192 |
| Private medical sector | 43.7 | 34.4 | 34.4 | 151 |
| Total | 44.2 | 34.0 | 33.7 | 344 |

Note: Table includes only the contraceptive methods separately shown and excludes users who obtained their method from friends/relatives. Total includes women who reported the initial source of the method as other sources, who are not shown separately.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Among women who were sterilized in the five years preceding the survey.
${ }^{2}$ Source at start of current episode of use.

## Table 26 First-year contraceptive discontinuation rates

Percentage of contraceptive users who discontinued use of a method within 12 months after beginning its use, by reason for discontinuation and percentage who switched to another method, by type of method, Kerala, 2005-06

|  | Method <br> failure | Desire to <br> become <br> pregnant | Side <br> effects/ <br> health <br> concerns | Infrequent <br> sex/ <br> husband <br> away | Other <br> reason | Total | Switched to <br> another <br> method $^{1}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Method | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Female sterilization | 2.9 | 16.3 | 2.6 | 18.3 | 20.9 | 61.0 | 13.7 |

Note: Total includes women belonging to other religions and women for whom caste/tribe was not known or is missing, who are not shown separately.
( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Unmet need for spacing includes pregnant women whose pregnancy was mistimed; amenorrhoeic women who are not using family planning and whose last birth was mistimed, or whose last birth was unwanted but now say they want more children; and fecund women who are neither pregnant nor amenorrhoeic, who are not using any method of family planning, and say they want to wait 2 or more years for their next birth. Also included in unmet need for spacing are fecund women who are not using any method of family planning and say they are unsure whether they want another child or who want another child but are unsure when to have the birth.
Unmet need for limiting refers to pregnant women whose pregnancy was unwanted; amenorrhoeic women who are not using family planning, whose last child was unwanted, and who do not want any more children; and fecund women who are neither pregnant nor amenorrhoeic, who are not using any method of family planning, and who want no more children. Excluded from the unmet need category are pregnant and amenorrhoeic women who became pregnant while using a method (these women are in need of a better method of contraception).
${ }^{2}$ Using for spacing is defined as women who are using some method of family planning and say they want to have another child or are undecided whether to have another. Using for limiting is defined as women who are using and who want no more children. Note that the specific methods used are not taken into account here.
${ }^{3}$ Nonusers who are pregnant or amenorrhoeic whose pregnancy was the result of a contraceptive failure are not included in the category of unmet need, but are included in total demand for contraception (since they would have been using had their method not failed).

( ) Based on 25-49 unweighted cases.

* Ratio not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or greater than 34 years and 2 months, latest birth less than 15 months ago, or latest birth of order 3 or higher.
${ }^{2}$ Includes the category age $<18$ and birth order $>3$.
${ }^{2}$ ancludes sterilized women.

## Table 33 Antenatal care

Percent distribution of women who had a live birth in the five years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth, according to background characteristics, Kerala, 2005-06

| Background characteristic | Doctor | ANM/nurse/ midwife/ LHV | Other health personnel | Dai/TBA | Anganwadi/ ICDS worker | Other | No one | Missing | Total | Number of women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Percentage of births delivered in a health facility ${ }^{2}$ | 99.5 | 93.0 | 88.9 |
| Percentage of deliveries assisted by health personne ${ }^{2,3}$ | 99.7 | 94.0 | 90.5 |

${ }^{1}$ Based on the last birth to ever-married women in the three years preceding the survey.
${ }^{2}$ Based on the last two births to ever-married women in the three years preceding the survey.
${ }^{3}$ Doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, or other health personnel.

## Table 40 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present during at least one antenatal care visit, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Kerala, 2005-06

| Antenatal/delivery care and information | Urban | Rural | Total |
| :---: | :---: | :---: | :---: |
| Percentage of men for whom the youngest child's mother received antenatal care | (100.0) | 100.0 | 100.0 |
| Percentage of men who were present at any antenatal care visit | (93.5) | 90.1 | 91.2 |
| Percentage who were told by a health provider or health worker about the following signs of pregnancy complications: |  |  |  |
| Vaginal bleeding | (41.3) | 36.3 | 37.9 |
| Convulsion | (30.4) | 23.1 | 25.5 |
| Prolonged labour | (56.5) | 44.0 | 48.2 |
| Percentage ever told what to do if mother had any pregnancy complication | (60.9) | 47.3 | 51.8 |
| Percentage whose youngest child was delivered in a health facility | (100.0) | 98.9 | 99.3 |
| Percentage to whom a health provider or worker spoke about the following aspects of maternal care: |  |  |  |
| The importance of delivering in a health facility | (63.0) | 60.4 | 61.3 |
| The importance of proper nutrition for the mother during pregnancy <br> Family planning or delaying his next child | $\begin{aligned} & (89.1) \\ & (60.9) \end{aligned}$ | 83.5 59.3 | 85.4 59.9 |
| Number of men with a child age 0-35 months | 46 | 91 | 137 |
| Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of: |  |  |  |
| Breastfeeding the baby immediately after birth | nc | * | * |
| Cleanliness at the time of delivery | nc | * | * |
| Number of men whose last child age 0-35 months was not delivered in a health facility | 0 | 1 | 1 |
| $\mathrm{nc}=$ Not calculated because there are no cases <br> ( ) Based on 25-49 unweighted cases. <br> * Percentage not shown; based on fewer than 25 unweighted cases |  |  |  |

Table 50 Breastfeeding status by age
Percent distribution of youngest children under three years living with the mother by breastfeeding status and percentage of all children under three years using a bottle with a nipple, according to age in months, Kerala, 2005-06

| Age in months | Not breastfeeding | Exclusively breastfed | Breastfeeding and consuming: |  |  |  | Total | Number of youngest children under three years | Percentage using a bottle with a nipple ${ }^{1}$ | Number of children |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Plain water only | Non-milk liquids/ juice | Other milk | Complementary foods |  |  |  |  |
| $<2$ | * | * | * | * | * | * | 100.0 | 13 | * | 13 |
| 2-3 | (0.0) | (59.3) | (6.2) | (0.0) | (6.2) | (28.2) | 100.0 | 32 | (15.6) | 32 |
| 4-5 | (0.0) | (39.3) | (0.0) | (3.6) | (7.1) | (50.1) | 100.0 | 28 | (10.7) | 28 |
| 6-8 | (2.0) | (2.0) | (0.0) | (0.0) | (2.0) | (93.9) | 100.0 | 49 | (20.0) | 50 |
| 9-11 | 6.0 | 2.0 | 0.0 | 0.0 | 0.0 | 92.0 | 100.0 | 50 | 19.7 | 51 |
| 12-17 | 4.1 | 0.8 | 0.8 | 0.0 | 1.7 | 92.5 | 100.0 | 121 | 14.5 | 124 |
| 18-23 | 23.1 | 0.0 | 0.0 | 0.0 | 1.1 | 75.8 | 100.0 | 91 | 13.6 | 95 |
| 24-35 | 63.5 | 0.0 | 0.0 | 0.0 | 0.0 | 36.5 | 100.0 | 181 | 11.5 | 209 |
| <4 | (0.0) | (66.7) | (6.6) | (0.0) | (6.6) | (20.1) | 100.0 | 45 | (11.1) | 45 |
| $<6$ | 0.0 | 56.2 | 4.1 | 1.4 | 6.8 | 31.6 | 100.0 | 73 | 10.9 | 73 |
| 6-9 | 3.2 | 1.6 | 0.0 | 0.0 | 1.6 | 93.6 | 100.0 | 63 | 21.6 | 65 |
| 12-23 | 12.3 | 0.5 | 0.5 | 0.0 | 1.4 | 85.4 | 100.0 | 212 | 14.1 | 219 |

Note: Breastfeeding status refers to a '24-hour' period (yesterday and last night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water only, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus any children who get complementary food are classified in that category as long as they are breastfeeding as well. Children who receive breast milk and non-milk liquids and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water.
( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Based on all children under three years.

Table 69 Control over and magnitude of cash earnings
Percentage of currently married women and men age 15-49 by person who decides how women's and men's cash earnings are used and by the magnitude of women's cash earnings compared with their husband's cash earnings, Percentage of
according to background characteristics, Kerala, 2005-06

Note: Total includes women and men belonging to other religions and women/men for whom caste/tribe was not known or is missing, who are not shown separately.
$\mathrm{nc}=$ Not calculated because there are no cases
() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

Table 71 Decision making by background characteristics
Percentage of currently married women who usually make four specific kinds of decisions, either by themselves or jointly with their husband, and percentage of currently married men who say that wives should have an equal or greater say than their husband in five specific kinds of decisions, by background characteristics, Kerala, 2005-06

| Background characteristic | Percentage of women who usually make specific decisions alone or jointly with their husband |  |  |  | Percentage who participate in all four decisions | Percentage who participate in none of the four decisions | Number of women | Percentage of men who say that wives should have an equal or greater say than their husband in: |  | Number of men |

| Teacher | 0.0 | 1.2 | 0.2 |
| Employer/someone at work | 0.4 | 0.0 | 0.4 |
| Other | 0.4 | 2.4 | 0.7 |
| Number who experienced physical violence | 322 | 57 | 379 |
| Person committing sexual violence |  |  |  |
| Current husband | 70.4 | * | 63.1 |
| Former husband | 11.4 | * | 10.3 |
| Current/former boyfriend | 0.0 | * | 0.6 |
| Step father | 0.0 | * | 1.2 |
| Other relative | 5.4 | * | 9.7 |
| In-law | 0.0 | * | 1.2 |
| Own friend/acquaintance | 6.1 | * | 7.3 |
| Family friend | 2.0 | * | 2.4 |
| Stranger | 4.7 | * | 4.2 |
| Number who experienced sexual violence | 99 | 11 | 111 |
| Note: All women were asked about their experience of physical violence since age 15. Evermarried women were also asked about their experience of spousal physical violence at any age. <br> * Percentage not shown; based on fewer than 25 unweighted cases. |  |  |  |

## Table 76 Forms of spousal violence

Percentage of ever-married women age 15-49 who have experienced various forms of violence committed by their husband ever or in the 12 months preceding the survey, Kerala, 2005-06

| Type of violence | Ever | In the past 12 months ${ }^{1}$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Often | Sometimes | Often or sometimes |
| Physical violence |  |  |  |  |
| Any form of physical violence | 15.3 | 2.2 | 7.7 | 9.9 |
| Pushed her, shook her, or threw something at her | 6.9 | 1.4 | 3.3 | 4.7 |
| Slapped her | 14.4 | 1.6 | 7.7 | 9.3 |
| Twisted her arm or pulled her hair | 6.2 | 1.5 | 2.6 | 4.2 |
| Punched her with his fist or with something that could hurt her | 3.6 | 0.8 | 1.4 | 2.2 |
| Kicked her, dragged her, or beat her up | 3.8 | 0.9 | 1.5 | 2.4 |
| Tried to choke her or burn her on purpose | 1.1 | 0.3 | 0.3 | 0.6 |
| Threatened her or attacked her with a knife, gun, or any other weapon | 1.2 | 0.3 | 0.3 | 0.5 |
| Sexual violence |  |  |  |  |
| Any form of sexual violence | 4.8 | 1.0 | 2.8 | 3.9 |
| Physically forced her to have sexual intercourse with him even when she did not want to | 4.4 | 1.0 | 2.5 | 3.5 |
| Forced her to perform any sexual acts she did not want to | 2.3 | 0.6 | 1.1 | 1.7 |
| Emotional violence |  |  |  |  |
| Any form of emotional violence | 10.1 | 1.8 | 5.2 | 7.1 |
| Said or did something to humiliate her in front of others | 9.1 | 1.5 | 4.9 | 6.4 |
| Threatened to hurt or harm her or someone close to her | 3.5 | 0.6 | 1.3 | 1.9 |
| Insulted her or made her feel bad about herself | 3.8 | 0.8 | 1.6 | 2.3 |
| Any form of physical and/or sexual violence | 16.4 | 2.5 | 8.6 | 11.2 |
| Any form of physical and sexual violence | 3.7 | 1.2 | 1.7 | 2.9 |
| Any form of physical and/or sexual and/or emotional violence | 19.8 | 3.5 | 10.5 | 14.0 |
| Any form of physical and sexual and emotional violence | 2.1 | 1.1 | 0.8 | 1.9 |
| Any violence by women against their husband ${ }^{2}$ | 0.0 | 0.0 | 0.0 | 0.0 |
| Number of ever-married women | 1,824 | 1,773 | 1,773 | 1,773 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.
${ }^{1}$ Excludes widows.
${ }^{2}$ Any violence by women against their husband when he was not already beating or physically hurting them.

## Table 77 Spousal violence by background characteristics

Percentage of ever-married women age 15-49 by whether they have ever experienced emotional, physical, or sexual violence committed by their husband, according to background characteristics, Kerala, 2005-06

| Background characteristic | Emotional violence | Physical violence | Sexual violence | Physical or sexual violence | Emotional, physical, or sexual violence | Number of women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age |  |  |  |  |  |  |
| 15-19 | (0.0) | (5.2) | (3.5) | (8.7) | (8.7) | 38 |
| 20-24 | 5.8 | 6.8 | 2.3 | 7.8 | 11.0 | 207 |
| 25-29 | 6.1 | 11.7 | 2.9 | 12.9 | 14.5 | 328 |
| 30-39 | 11.5 | 18.3 | 6.6 | 19.7 | 23.4 | 685 |
| 40-49 | 13.0 | 17.5 | 4.8 | 18.1 | 22.3 | 566 |
| Residence |  |  |  |  |  |  |
| Urban | 10.9 | 14.1 | 3.5 | 14.4 | 17.9 | 632 |
| Rural | 9.7 | 15.9 | 5.5 | 17.4 | 20.7 | 1,192 |
| Education |  |  |  |  |  |  |
| No education | 21.0 | 23.5 | 9.2 | 26.0 | 30.2 | 80 |
| <5 years complete | 17.5 | 28.1 | 9.4 | 28.1 | 33.0 | 164 |
| 5-9 years complete | 10.3 | 18.0 | 5.6 | 19.7 | 22.0 | 771 |
| 10 or more years complete | 7.4 | 9.2 | 2.7 | 9.9 | 13.9 | 809 |
| Employment (past 12 months) |  |  |  |  |  |  |
| Employed | 14.8 | 24.8 | 8.0 | 26.0 | 29.2 | 544 |
| Employed, for cash | 15.8 | 24.9 | 8.3 | 26.1 | 29.6 | 498 |
| Employed, not for cash | (4.3) | (23.2) | (4.4) | (24.6) | (24.6) | 46 |
| Not employed | 8.1 | 11.2 | 3.4 | 12.2 | 15.7 | 1,278 |
| Marital status |  |  |  |  |  |  |
| Currently married | 9.1 | 13.6 | 4.3 | 14.6 | 18.1 | 1,733 |
| Widowed | 13.2 | 33.0 | 1.3 | 33.0 | 34.3 | 51 |
| Divorced/separated/deserted | (51.7) | (66.7) | (31.7) | (70.1) | (71.8) | 40 |
| Marital status and duration ${ }^{1}$ |  |  |  |  |  |  |
| Married only once | 9.0 | 13.5 | 4.3 | 14.6 | 18.1 | 1,701 |
| 0-4 years | 3.3 | 4.1 | 1.4 | 5.1 | 7.3 | 339 |
| 5-9 years | 4.9 | 12.2 | 3.3 | 13.4 | 15.5 | 327 |
| $10+$ years | 12.2 | 17.0 | 5.5 | 18.2 | 22.5 | 1,035 |
| Married more than once | (10.4) | (14.5) | (4.2) | (14.5) | (18.6) | 32 |
| Number of living children |  |  |  |  |  |  |

| Total | 10.1 | 15.3 | 4.8 | 16.4 | 19.8 | 1,824 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women belonging to other religions and with missing information on husband's education, husband's alcohol consumption, spousal age difference, and spousal education difference, who are not shown separately.
() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Currently married women only.
${ }^{2}$ Behaviours include: he is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money.
${ }^{3}$ Currently married women only. Decisions included are decisions about own health care, major household purchases, purchases for daily household needs, and visits to her family or relatives.
${ }^{4}$ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook food properly, he suspects she is unfaithful, and she shows disrespect for in-laws.
${ }^{5}$ Reasons given for refusing to have sexual intercourse with husband include: she knows husband has a sexually transmitted disease, she knows husband has sex with other women, and she is tired or not in the mood.

Table 79 Injuries to women due to spousal violence
Percentage of ever-married women age 15-49 who have experienced specific types of spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Kerala, 2005-06

## APPENDIX A

## ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) nonsampling errors and (2) sampling errors. Nonsampling errors are the result of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the third National Family Health Survey (NFHS-3) to minimize this type of error, nonsampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-3 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-3 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-3 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, $r=y / x$, where $y$ represents the total sample value for variable $y$, and $x$ represents the total number of cases in the group or subgroup under consideration. The variance of $r$ is computed using the formula given below, with the standard error being the square root of the variance:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1-f}{x^{2}} \sum_{h=1}^{H}\left[\frac{m_{h}}{m_{h}-1}\left(\sum_{i=1}^{m_{h}} z_{h i}^{2}-\frac{z_{h}^{2}}{m_{h}}\right)\right]
$$

in which

$$
z_{h i}=y_{h i}-r x_{h i}, \text { and } z_{h}=y_{h}-r x_{h}
$$

where $h \quad$ represents the stratum, which varies from 1 to $H$,
$m_{h}$ is the total number of clusters selected in the $h^{\text {th }}$ stratum,
$y_{h i}$ is the sum of the weighted values of variable $y$ in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum,
$x_{h i} \quad$ is the sum of the weighted number of cases in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum,
and
$f \quad$ is the overall sampling fraction, which is so small that it is ignored.
The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-3 sample for Kerala, there were 125 clusters. Hence, 125 replications were created. The variance of a rate $r$ is calculated as follows:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1}{k(k-1)} \sum_{i=1}^{k}\left(r_{i}-r\right)^{2}
$$

in which

$$
r_{i}=k r-(k-1) r_{(i)}
$$

where $r \quad$ is the estimate computed from the full sample of 125 clusters,
$r_{(i)}$ is the estimate computed from the reduced sample of 124 clusters ( $i^{\text {th }}$ cluster excluded), and
$k \quad$ is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ) for each estimate are also computed.

Sampling errors for NFHS-3 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Kerala as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, ratio, or percentage) and the base population are given in Table A.1. Table A. 2 presents the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ) for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1 ). In the case of the total fertility rate, the number of unweighted cases is not relevant, as there is no known unweighted value for woman-years of exposure to childbearing.

| Variable | Estimate | Base population |
| :---: | :---: | :---: |
| Sex ratio (females per 1,000 males) | Ratio | De facto household population, all ages |
| No education | Proportion | De facto household population of females/males age 6 and above |
| Tuberculosis prevalence | Rate | 100,000 usual household residents |
| Using adequately iodized salt | Proportion | Households |
| Urban residence | Proportion | Women/men age 15-49 |
| No education | Proportion | Women/men age 15-49 |
| Completed 10 or more years of education | Proportion | Women/men age 15-49 |
| Never married, including married gauna not performed | Proportion | Women/men age 15-49 |
| Currently married | Proportion | Women/men age 15-49 |
| Married before age 18 | Proportion | Women age 20-49 |
| Married before age 21 | Proportion | Men age 25-49 |
| Currently using any method | Proportion | Currently married women age 15-49 |
| Currently using a modern method | Proportion | Currently married women age 15-49 |
| Currently using a traditional method | Proportion | Currently married women age 15-49 |
| Currently using female sterilization | Proportion | Currently married women age 15-49 |
| Currently using pill | Proportion | Currently married women age 15-49 |
| Currently using IUD | Proportion | Currently married women age 15-49 |
| Currently using condom | Proportion | Currently married women age 15-49 |
| Using public medical sector source of contraception | Proportion | Women age 15-49 currently using modern methods of contraception |
| Want no more children | Proportion | Currently married women/men age 15-49 |
| Want to delay next birth at least 2 years | Proportion | Currently married women/men age 15-49 |
| Ideal number of children | Mean | Women/men age 15-49 |
| Mother received ANC from health personnel | Proportion | Women with at least one birth in last five years (last birth) |
| Took iron and folic acid (IFA) for 90 days or more | Proportion | Women with at least one birth in last five years (last birth) |
| Births delivered by a skilled provider | Proportion | Births in last 5 years |
| Institutional delivery | Proportion | Births in last 5 years |
| Postnatal check for mother within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Treated with ORS packets | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Children with diarrhoea taken to a health provider | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Child's vaccination card seen by interviewer | Proportion | Children age 12-23 months |
| Child received BCG vaccination | Proportion | Children age 12-23 months |
| Child received DPT vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received polio vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received measles vaccination | Proportion | Children age 12-23 months |
| Child fully vaccinated | Proportion | Children age 12-23 months |
| Children given vitamin A supplement in last 6 months | Proportion | Children age 6-59 months |
| Ever experienced physical or sexual violence | Proportion | Women age 15-49 |
| Weight-for-height, wasting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Height-for-age, stunting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-age, underweight (below -2SD) | Proportion | Children under age 5 years who were measured |
| Body mass index (BMI) $<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women/men age 15-49 who were measured |
| Body mass index $(\mathrm{BMI}) \geq 25.0 \mathrm{kgm}^{2}$ | Proportion | Women/men age 15-49 who were measured |
| Have heard of AIDS | Proportion | Women/men age 15-49 |
| Have comprehensive knowledge about HIV/AIDS | Proportion | Women/men age 15-49 |
| Total and age-specific fertility rates (last 3 years) | Rate | Women years of exposure |
| Mortality rates | Rate | Births in last 5 years |
| Women/men with any anaemia | Proportion | Women/men age 15-49 |
| Children with any anaemia | Proportion | Children age 6-59 months |

| na $=$ Not applicable <br> $\mathrm{nc}=$ Not calculated because the denominator is zero |  |  |  |  |  |  |  |  |

[^0]:    ( ) Based on 25-49 unweighted cases.

    * Percentage not shown; based on fewer than 25 unweighted cases.

[^1]:    na $=$ Not applicable
    ${ }^{1}$ Refers to women/men who can read a whole sentence or part of a sentence and women/men who completed standard 6 or higher (who are assumed to be literate).

[^2]:    Note: Women who have been sterilized or whose husband has been sterilized are considered to want no more children. Men who are sterilized or who mention in response to the question about desire for children that their wife has been sterilized are considered to want no more children. Total includes women and men belonging to other religions and women/men for whom caste/tribe was not known or is missing, who are not shown separately.
    na $=$ Not applicable
    nc $=$ Not calculated because there are no cases
    ( ) Based on 25-49 unweighted cases.

    * Percentage not shown; based on fewer than 25 unweighted cases.
    ${ }^{1}$ Includes current pregnancy of woman/wife.
    ${ }^{2}$ Includes women and men with no children, who are not shown separately.
    ${ }^{3}$ Excludes pregnant women and men with pregnant wives.

[^3]:    na $=$ Not applicable
    () Based on 25-49 unweighted cases.

    * Percentage not shown; based on fewer than 25 unweighted cases.
    ${ }^{1}$ Includes current pregnancy for women or wife's current pregnancy for men.
    ${ }^{2}$ Means are calculated excluding respondents who gave non-numeric responses.

[^4]:    $\mathrm{nc}=$ Not calculated because there are no cases

    * Percentage not shown; based on fewer than 25 unweighted cases.
