## Introduction

The 2015-16 National Family Health Survey (NFHS-4), the fourth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. For the first time, NFHS-4 provides district-level estimates for many important indicators. All four NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-4 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation (BMGF), UNICEF, UNFPA, the MacArthur Foundation, and the Government of India. Technical assistance for NFHS-4 was provided by ICF, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires - household, woman's, man's, and biomarker-were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-4. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, and treatment of childhood illnesses, was fielded in the entire sample of NFHS-4 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/ AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-4 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV / AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, haemoglobin, blood pressure, and random blood glucose for women age 15-49 years and men age 15-54 years, and the collection of finger-stick blood for HIV testing in a laboratory. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-4 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 640 districts in India, as of the 2011 Census). The total sample size of approximately 572,000 households for India was based on the size needed to produce reliable indicator estimates for each district and for urban and rural areas in districts in which the urban population accounted for $30-70$ percent of the total district population. The rural sample was selected
through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

The figures of NFHS-4 and earlier rounds may not be strictly comparable due to differences in sample size, and NFHS-4 will be a benchmark for future surveys. NFHS-4 fieldwork for Goa was conducted in both districts of the state from 20 January to 6 April 2015 by the Goa Institute of Management (GIM) and collected information from 1,588 households, 1,696 women age 15-49 (including 828 women interviewed in PSUs in the state module), and 848 men age 15-54. Survey response rates were 99 percent each for households and women, and 97 percent for men.

This report presents the key findings of the NFHS-4 survey in Goa, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

## Household Characteristics

## Household composition

Slightly less than two-thirds ( $64 \%$ ) of Goa's households are in urban areas. On average, households are comprised of 4 members. Twenty-two percent of households are headed by women, with 20 percent of the population living in female-headed households.

The majority of households in Goa have household heads who are Hindu (68\%). Twenty-four percent of households have household heads who are Christian and 8 percent have Muslim household heads.

More than three-fifths ( $63 \%$ ) of Goa's household heads do not belong to scheduled castes, scheduled tribes, or other backward classes. About one-quarter ( $24 \%$ ) belong to an other backward class (OBC), 6 percent have household heads who belong to a scheduled caste, and 7 percent belong to a scheduled tribe.

Twenty-three percent of Goa's population is under age 15; only 8 percent is age 65 and over. The overall sex ratio of the population is 1,018 females per 1,000 males, and the sex ratio of the population under seven years of age is only 897 females per 1,000 males. Eighty-four percent of persons have an Aadhaar card.

Among children below 18 years of age, 5 percent have experienced the death of one or both parents. In all, 86 percent of children below 18 years of age live with both parents, 12 percent live with one parent (mostly with their mother), and the remaining 2 percent live with neither parent. Births of almost all $(99 \%)$ children under five years of age were registered with the civil authorities, and 97 percent of children have a birth certificate.

## Housing characteristics

More than four-fifths (84\%) of households in Goa live in a рисса house and nearly all households have electricity. Eleven percent of households do not use a sanitation facility, which means that household members practice open defecation, a substantial improvement from 24 percent at the time of NFHS-3. Open defecation is more common among rural households (14\%) than urban households (9\%).

Ninety percent of households in Goa have water piped into their dwelling, yard, or plot.

Ninety-six percent of households use an improved source of drinking water, and 90 percent have water piped into their dwelling, yard, or plot. Urban households (95\%) are more likely than rural households $(80 \%)$ to have water piped in to their dwelling, yard, or plot. Eighty-five percent of households treat their drinking water to make it potable (mostly by boiling). More than four-fifths $(84 \%)$ of households use a clean fuel for cooking.

## Selected household possessions

Almost all urban and rural households ( $97 \%$ ) in Goa have a mobile phone. Ninety-six percent of households have a bank or post office account. BPL cards are held by 13 percent of households, up from 7 percent in NFHS-3. Agricultural land is owned by 17 percent of rural households and 7 percent of urban households. Overall, one in 10 households in Goa own agricultural land.

## EdUCATION

## School attendance among children

Ninety-six percent of children age 6-17 years in Goa attend school (96\% in urban areas and $97 \%$ in rural areas). School attendance is almost universal (99\%) at age 6-14 years, and then drops to 91 percent at ages 15-17. There is no gender disparity in school attendance in the 6-14 year age group, however, girls age 15-17 are slightly more likely than boys to attend school.

## Literacy, educational attainment and media exposure

In NFHS-4, literate persons are those who have either completed at least standard six or passed a simple literacy test conducted as part of the survey. According to this measure, 89 percent of women age 15-49 and 95 percent of men age 15-49 are literate.

Nine percent of women and 4 percent of men age 15-49 have never been to school. Over onethird of women and men age 15-49 ( $35 \%$ versus $36 \%$ ) have completed 12 or more years of schooling.

Media exposure is high among women and men in Goa. Ninety-four percent of women and 97 percent of men watch television at least once a week. However, men ( $82 \%$ ) are much more likely than women $(63 \%)$ to read a newspaper or magazine at least once a week. Only 4 percent of women and 1 percent of men are not regularly exposed to print media or other forms of media.

Over one-third of women and men age 15-49 have completed 12 or more years of schooling.

## Fertility

## Age at first marriage

The median age at first marriage is 24.2 years among women age $25-49$ years. Ten percent of women age 20-24 years got married before the legal minimum age of 18, down slightly from 12 percent in NFHS-3. Eight percent men age 25-29 years got married before the legal minimum age of 21 , up slightly from 7 percent of men in NFHS-3.

## Fertility levels

The total fertility rate (TFR) in Goa is 1.7 children per woman, well below the replacement level of fertility of 2.1 children. Fertility decreased by 0.1 children in the 13 years between NFHS-1 and NFHS-3, and declined further by 0.1 children in the 10 years between NFHS-3 and NFHS-4.

The total fertility rate is 1.7 children per woman in urban areas and 1.6 in rural areas. Among births in the three years

## Fertility Trends

Total fertility rate
(children per woman)
 preceding the survey, 4 percent were of birth order four or higher, compared with 6 percent in NFHS-3.

The greatest differentials in fertility are by religion, caste/tribe, and schooling. At current fertility rates, women with no schooling will have 1.6 children more than women with 12 or more years of schooling (TFR of 3.2, compared with 1.6). Muslim women will have an average of 1.3 children more than Hindu women.

## How does fertility vary with schooling? Total fertility rate (children per woman)

## Pregnancy outcome

Ninety-one percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 9 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Miscarriage is the most commonly reported type of foetal wastage, accounting for 6 percent of all pregnancies, and abortions account for 3 percent.

## Teenage pregnancy

Among young women age 15-19 in Goa, 3 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, down from 4 percent in NFHS-3. Less than 0.1 percent of women age 15-17 years have started childbearing, but this proportion increases to 6 percent among women age 18 years and to 11 percent among women age 19 years.

## Birth intervals

The median interval between births in the five years before the survey in Goa is 39.3 months, two months shorter than in NFHS-3. Seven percent of births take place within 18 months of the last birth and 20 percent occur within 24 months. Almost half ( $45 \%$ ) of births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality.

> Forty-five of births in Goa occur within three years of the previous birth.

## Fertility preferences

Sixty-one percent of currently married women and 65 percent of currently married men want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, 28 percent of women and 51 percent of men would like to wait at least two years before the next birth. Ninety-two percent of women and men consider the ideal family size to be two or fewer children.

In Goa there is not much preference for sons. Just 5 percent of women and 10 percent of men want more sons than daughters, and 4 percent of women and 3 percent of men want more daughters than sons. Most men and women would like to have at least one son and at least one daughter.

Women and men with one child are much more likely to want another child if their first child is a girl than a boy. Among women, 22 percent with one daughter and no sons want no more children, compared with 42 percent with one son and no daughters. The difference is somewhat smaller for men ( $21 \%$ and $32 \%$ ). Notably, however, the proportion of currently married women and men with two children who want no more children irrespective of their number of sons has remained almost unchanged in the 10 years since NFHS-3.

In Goa, unplanned pregnancies are relatively common. If all women were to have only the number of children they want, the total fertility rate would have been 1.4 children per woman, instead of the current level of 1.7 children per woman.

## Family Planning

## Contraceptive knowledge and use

Knowledge of contraception is almost universal in Goa. However, some methods are still less well known. Sixty-five percent of currently married women know about female condoms and 20 percent know about the lactational amenorrhoea method (LAM). Among all women, 61 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 1549 is 26 percent, much lower than in NFHS-3 (48\%). Modern method use, at 25 percent, has also declined from its level in NFHS-3 (37\%). Notably, the share of female sterilization in contraceptive method use decreased from 26 percent to 16 percent in the 10 years between NFHS-3 and NFHS-4. Contraceptive use in NFHS-4 increases sharply with age, from 17 percent among women age 20-24 to 29 percent among women age 25-39, and then decreases to 24
 percent for women age 40-49.

In Goa, contraceptive use is more than twice as high in urban areas ( $33 \%$ ) as in rural areas ( $14 \%$ ). Contraceptive prevalence varies greatly by the level of schooling; decreasing from 36 percent among women with no schooling to $21-28$ percent among women with some schooling. Notably, nearly all women with no schooling who are currently using a method are sterilized, compared with 36 percent of contraceptive users with 12 or more years of schooling. Christian or Hindu women ( $24-25 \%$ ) are much less likely to use contraception than Muslim women (39\%).

The most common modern spacing method used by currently married women in Goa is condom/Nirodh (7\%). In general, urban women and better-educated women are more likely than other women to use spacing methods.

Seventy percent of sterilized women had their sterilization operation in a public sector health facility, mainly in a government or municipal hospital.

What contraceptive methods do women use? Currently married women

About three-fourths of condom/Nirodh users (77\%) get their supply from the private sector, primarily from a pharmacy or drug store (72\%). Nonetheless, 10 percent of condom/Nirodh users get their supply from the public sector.

The 12-month discontinuation rate for all methods is 48 percent. The most common reason for discontinuation is the desire to become pregnant.

> Almost half of users of contraceptive methods discontinued use within the first year after they adopted the method.

## Men's attitudes

More than one-third of men age 15-49 in Goa (37\%) accept the idea that contraception is women's business and a man should not have to worry about it. Only 3 percent of men agree with the idea that women using contraception may become promiscuous. One in two men know that a condom, if used correctly, protects against pregnancy most of the time.

## Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 18 percent of currently married women have an unmet need for family planning, a 2 percentage point increase since NFHS-3. Sixty percent of the demand for family planning is being satisfied and 57 percent of the demand is being satisfied by modern methods.

Contraceptive Prevalence Rate by District Percentage of currently married women

## Infant and Child Mortality

The infant mortality rate in Goa in NFHS-4 is estimated at 13 deaths before the age of one year per 1,000 live births, down from the NFHS-3 estimate of 15, the NFHS-2 estimate of 37, and the NFHS-1 estimate of 32 .

> Trends in Infant Mortality
> Deaths per 1,000 live births

## Maternal Health

## Antenatal care

More than nine in 10 mothers who gave birth in the five years preceding the survey received antenatal care (ANC) for their last birth from a health professional ( $87 \%$ from a doctor and $7 \%$ from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Three percent did not receive any antenatal care. For 91 percent of last births to mothers who gave birth in the five years preceding the survey, the pregnancy was registered. Among the registered pregnancies, 96 percent received a Mother and Child Protection Card (MCP Card).

Four or More Antenatal Care Visits by District Percentage of last births in the past five years

More than four-fifths ( $84 \%$ ) of women had an antenatal care visit during the first trimester of pregnancy, as is recommended. Eighty-nine percent of mothers had four or more antenatal care visits; urban women were more likely to have four or more antenatal care visits than rural women. The proportion of women who had four or more antenatal care visits and the proportion of women who had their first antenatal care visit in the first trimester of pregnancy for their last births have not changed much in the 10 years since NFHS-3. For 94 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 67 percent consumed them for the recommended 100 days or more. Ninety-six percent of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. More than half ( $58 \%$ ) of mothers took an intestinal parasite drug during pregnancy.

Eighty-nine percent of mothers in Goa had at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, more than 90 percent received advice on each of the five different areas ( $93 \%$ received advice on breastfeeding, $92 \%$ on the importance of institutional delivery, $91 \%$ on keeping the baby warm and on family planning, and $90 \%$ on cord care).

How does appropriate antenatal care vary with schooling?
Percentage of last births in the past five years

Note: Categories 'No schooling' and '<5 years complete' not shown since there are fewer than 25 unweighted cases.

In Goa, almost all women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy (having their weight taken and their blood pressure measured, having a blood sample taken, having a urine sample taken, and having their abdomen examined.

An ultrasound test was performed during 90 percent of pregnancies in the five years preceding the survey.

## Delivery care

Almost all the births (97\%) take place in a health facility (mostly a government facility) and only 3 percent take place at home. The percentage of births in a health facility increased in the 10 years between NFHS-3 and NFHS-4, from 92 percent in NFHS-3 to 97 percent in NFHS-4. Ninety-eight percent of births during the past five years took place with assistance from health personnel.

Thirty-one percent of births during the past five years were delivered by caesarean section. About half of caesarean sections
 ( $15 \%$ of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 7 percent received financial assistance under the Janani Suraksha Yojana (JSY).

Ninety-seven percent of children in Goa who were born in the last five years were born in a health facility.

## Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Goa, 93 percent of mothers had a postnatal check after their last birth and the same percentage had a postnatal check within two days of the birth, as is recommended. Only half of last births in the five years preceding the survey received a health check in the first two days after birth.

## Male involvement in maternal care

All men with a child under three years of age said that the youngest child's mother received antenatal care. Ninety-six percent of men with a child under three years said they were present during at least one antenatal check received by the child's mother (all men in urban areas and $91 \%$ in rural areas), but only 89 percent were told by a health provider or health worker what to do if the mother had a pregnancy complication.

Between 88 and 95 percent of men were told about the signs of specific pregnancy complications (convulsions, vaginal bleeding, high blood pressure, prolonged labour, and severe abdominal pain).

Ninety-four to 98 percent of fathers with a child less than three years of age were given information about various aspects of maternal care; about the importance of delivering the baby in a health facility (about family planning or delaying his next birth, and about the importance of proper nutrition for the mother during pregnancy).

## Child Health

## Vaccination of children

Nearly nine in 10 children age 12-23 months ( $88 \%$ ) received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey.

All children have received a BCG vaccination. In addition, more than nine in 10 children have received other basic vaccinations ( $93 \%$ have received at least the three recommended doses of polio vaccine, $94 \%$ have received the three recommended doses of DPT vaccine, and $97 \%$ have been vaccinated against measles). There is some dropout between the first and third doses of polio vaccine (from $100 \%$ to $93 \%$ ).

Trends in Vaccination Coverage
Percentage of children 12-23 months receiving vaccinations

NFHS-1 ■NFHS-2 ■NFHS-3 ■NFHS-4

Between NFHS-3 and NFHS-4, there was an increase in vaccination coverage for three doses of DPT (from $88 \%$ to $94 \%$ ) and an increase for BCG (from 97\% to $100 \%$ ), measles ( $91 \%$ to $97 \%$ ), and three doses of polio vaccine (from $87 \%$ to $93 \%$ ). Overall, there was an increase in the coverage of all basic vaccinations (from $79 \%$ to $88 \%$ ). In addition, almost all children ( $92 \%$ ) have received at least one dose of hepatitis B vaccine, and 85 percent have received all three recommended doses of hepatitis $B$ vaccine.

Coverage of All Basic Vaccinations by District
Percentage of children 12-23 months

## Childhood illnesses

In the two weeks before the survey, 1 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related).

Sixteen percent of children under age five were reported to have had fever in the two weeks preceding the survey; 89 percent of these children were taken to a health facility or provider for treatment.

Overall, 4 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Ninety-six percent of women have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea.

## Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based anganwadi centres.

How many children received anganwadi centre services?
Percentage of age-eligible children receiving services

Fifty-eight percent of children under 6 years receive services of some kind from an anganwadi centre. The most common services that age-eligible children receive are supplementary food ( $56 \%$ ), growth monitoring ( $55 \%$ ), health check-ups ( $47 \%$ ), and early childhood care or preschool ( $38 \%$ ). The service that is least likely to be accessed immunization ( $35 \%$ of children age 0-71 months). More than three-fourths of the mothers of children who were weighed at an anganwadi centre ( $77 \%$ ) received counselling from an anganwadi worker or an ANM. Among children under 6 years, slightly more than two-thirds of their mothers ( $69 \%$ ) received any service from an anganwadi centre during pregnancy, and almost two-thirds (67\%) of their mothers received any service while breastfeeding.

## Breastreeding, Nutrition, and Anaemia

## Infant feeding

Although breastfeeding is nearly universal in Goa, only 61 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Ninetythree percent are put to the breast within the first day of life, but only 75 percent started breastfeeding in the first hour of life (as recommended). While the initiation of breastfeeding indicators show substantial improvement since NFHS-3, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, almost one in 10 children ( $9 \%$ ) are given something other than breastmilk during the first three days. Overall, 79 percent of children continue breastfeeding at 1 year and 66 percent of children continue breastfeeding at 2 years.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Goa, nine in 10 children age 9-59 months were given a vitamin A supplement in the past six months, but only 42 percent of children age 9-23 months ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Only one-fourth of children age 9-23 months ate ironrich foods during the day or night before the survey, but 56 percent of children age 6-59 months were given iron supplements in the week before the survey.

## Children's nutritional status

Twenty percent of children under age five years are stunted or too short for their age, which indicates that they have been undernourished for some time. Twenty-two percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 10 percent are severely wasted.

Twenty-four percent are underweight, which takes into account both chronic and acute undernutrition. Four percent of children are overweight. Stunting decreased from 26 percent to 20 percent in the 10 years between NFHS-3 and NFHS4, but the percentage of children who are underweight remained almost unchanged. In the same period, wasting increased from 14 percent to 22 percent. Despite the gains in stunting, child malnutrition is still a major problem in Goa. Stunting and underweight are higher for females than males.

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

## Adults' nutritional status

Nearly half $(48 \%)$ of women and 43 percent of men are either too thin or overweight or obese. Many more women and men are overweight or obese than thin, which is the opposite of the pattern in NFHS-3. Fifteen percent of women and 11 percent of men in Goa are thin (a substantial improvement since NFHS-3), but the percentage overweight or obese has dramatically increased from 20 percent of women and 15 percent of men in NFHS-3 to 33 percent each in NFHS-4. Fifty-two percent of women and 57 percent of men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups, in rural areas, among never married women and men, and among scheduled tribe women. Overweight or obesity are most prevalent in older adults, those in urban areas, those who are currently married, and those who are well educated. Because population groups that are less likely to be too thin are the same groups that are more likely to be overweight or obese, the percentage suffering from either of these two nutritional problems is fairly constant across many groups, regardless of their educational attainment, caste, age, residence, or marital status.

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Almost all ( $96 \%$ ) households in Goa were using iodized salt at the time of the survey, up from 77 percent in NFHS-3.

## Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworm and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Goa, especially among women and children.

Among children between the ages of 6 and 59 months, 48 percent are anaemic. This includes 30 percent who are mildly anaemic, 18 percent who are moderately anaemic, and less than 1 percent who suffer from severe anaemia. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. Forty-seven percent of children in Goa are anaemic even if their mother has 12 or more years of schooling.

Anaemia among women, men, and children
$■$ Severe anaemia ■ Moderate anaemia ■ Mild anaemia

Thirty-one percent of women in Goa have anaemia, including 25 percent with mild anaemia, 6 percent with moderate anaemia, and 1 percent with severe anaemia. Only 11 percent of men are anaemic. Anaemia among women has increased by 6 percentage points since NFHS-3. Men under age 20 are less likely to be anaemic than older men.

## Adult Health and Health Care

## Tuberculosis

In Goa, 74 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is slightly higher among men (77) than among women (71) and is higher in urban areas (100) than in rural areas (31).

More than 90 percent of respondents have heard of tuberculosis ( $97 \%$ of women and $92 \%$ of men). Among those who have heard of tuberculosis, 81 percent of women and 97 percent of men know that it is spread through the air by coughing or sneezing. A little less than half of women ( $48 \%$ ) and 61 percent of men have misconceptions about how tuberculosis is spread. Overall, 93 percent of women and 98 percent of men know that tuberculosis can be cured, and only 18 percent of women and 10 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

## Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 3,799 women age 15-49 and 3,013 men age 15-49 per 100,000 have diabetes. The prevalence of asthma is 1,008 per 100,000 women and 469 per 100,000 men. Asthma is considerably higher in rural areas than urban areas. Goitre or any other thyroid disorder is more common than asthma among women (1,764 women per 100,000). Men are much less likely to have goitre ( 158 men per 100,000 ) than women. The prevalence of any heart disease is higher among men ( 328 per 100,000) than among women (206 per 100,000). Among
the five diseases, cancer is the least common in women (40 women per 100,000). The prevalence of cancer in men ( 247 men per 100,000 ) is more common than goitre. The prevalence of all of the diseases is higher among older women (age 35-49) than younger women (age 15-34).

## Blood pressure (hypertension)

Twelve percent of women age 15-49 in Goa have hypertension, including 6 percent with Stage 1 hypertension, 2 percent with Stage 2 hypertension, and 1 percent with Stage 3 hypertension. Almost three-fifths of women (59\%) have normal blood pressure, including 1 percent of women with normal blood pressure who are taking medicine to lower their blood pressure. The prevalence of hypertension among men age 15-49 is slightly higher than among women. Fifteen percent of men in Goa have hypertension, including 11 percent with Stage 1 hypertension and 3 percent with Stage 2 hypertension. Only 37 percent of men have normal blood pressure, including 1 percent of men with normal blood pressure who are taking medicine to lower their blood pressure. For both women and men, hypertension increases with age.

## Blood glucose

NFHS-4 included measurement of random blood glucose among women age 15-49 and men age 15-54. Four percent of women age 15-49 in Goa have high blood glucose levels, and another 5 percent have very high blood glucose levels. In comparison, 5 percent and 7 percent of men age 15-49 have high and very high blood glucose levels, respectively. Older women and men are particularly likely to have high blood glucose levels.

## Health examinations

In Goa, half of women have ever undergone an examination of the cervix, 45 percent have ever undergone a breast examination, and 52 percent have ever undergone an examination of the oral cavity.

## Tobacco and alcohol use

Twenty-one percent of men, but only 2 percent of women, age 15-49 use some form of tobacco. Men are most likely to smoke cigarettes ( $11 \%$ ) and to use chewing tobacco without paan ( $6 \%$ ). Among men, the use of any form of tobacco is slightly higher in urban areas than in rural areas. Only 4 percent of men who smoke cigarettes or bidis smoked 10 or more cigarettes or bidis in the past 24 hours. Men ( $45 \%$ ) and women (4\%) are more likely to drink alcohol than to use tobacco. Among men who drink alcohol, over four-fifths drink alcohol at least once a week.

## Source of health care

Although the public health sector is the main source of health care for most households in Goa ( $54 \%$ ), the private sector is also a very important source ( $45 \%$ ). The public health sector is more important than the private health sector for rural households ( $62 \%$ versus $38 \%$ ), whereas the public and private health sectors are equally important for urban households. In the public health sector, government/municipal hospitals are the main source ( $31 \%$ ), followed by PHCs and additional PHCs $(10 \%)$. In the private health sector, private hospitals are the main source of health care ( $33 \%$ ). Twelve percent of household members in urban areas go to private doctors or clinics, compared with 9 percent in rural areas.

## Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, only 16 percent of households in Goa have any kind of health insurance that covers at least one member of the household. Health insurance coverage is more common in urban areas (19\%) than in rural areas ( $11 \%$ ). In Goa, four types of programmes dominate: the Employees' State Insurance Scheme (ESIS), privately purchased commercial health Insurance, the State Health Insurance Scheme, and the Central Government Health Scheme (CGHS).

Only 10 percent each of women and men age 15-49 years are covered by any health scheme or health insurance. More women and men in urban areas than in rural areas are covered by any health scheme or health insurance. Coverage by a health scheme or health insurance is higher among women and men with 12 or more years of schooling than among those with lower levels of schooling.

## HIV/AIDS

## Awareness of HIV or AIDS

Almost all women and men (97\% each) in Goa have heard of HIV or AIDS.

## Knowledge of prevention and transmission

Only 77 percent of women know that consistent condom use can help prevent HIV/AIDS, compared with 89 percent of men. However, almost the same percentage of women ( $83 \%$ ) and men ( $85 \%$ ) know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV / AIDS.

Only 35 percent of women and 42 percent of men in Goa have a 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthylooking person can have HIV/AIDS, and they reject two common misconceptions about the transmission or prevention of HIV/AIDS. Women (87\%) are more likely than men $(79 \%)$ to know that HIV/AIDS can be transmitted from a mother to her baby.

Do people know how to prevent HIVIAIDS?
Percentage of women and men age 15-49

## HIV-related stigma

Over four-fifths ( $84 \%$ ) of women and men ( $86 \%$ ) in Goa would be willing to take care of a relative with HIV/AIDS in their home. More than 90 percent of women ( $93 \%$ ) and men ( $96 \%$ ) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Eighty-three percent of women and 91 percent of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Fifty-nine percent of women and 64 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

## HIV testing prior to NFHS-4, blood transfusions, and safe injections

Only 44 percent of women and 30 percent of men age 15-49 had ever been tested for HIV prior to NFHS-4. Men in urban areas are somewhat more likely to have ever been tested for HIV prior to NFHS-4 than rural men. Forty-four percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Urban women ( $45 \%$ ) are slightly more likely than rural women ( $41 \%$ ) to have been tested for HIV during ANC.

Forty-four percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Goa, women (6\%) are somewhat more likely than men (3\%) to have ever had a blood transfusion. Women are as likely as men to have received an injection in the past 12 months ( $60 \%$ of women and $59 \%$ of men). For almost all adults who received an injection in the past 12 months, a disposable syringe was used.

## Sexual Behaviour

NFHS-4 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

## Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, 0.7 percent of women and 12 percent of men reported having had higher-risk sex during the past 12 months. Even fewer respondents said that they had multiple sex partners in the past 12 months ( $0.3 \%$ of women and $2 \%$ of men). Ninety percent of men who had higher-risk sex in the past 12 months reported using a condom the last time they had higher-risk sex. A negligible percentage of men ( $0.2 \%$ ) said they paid for sex in the past year.

## Women's Empowerment

## Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-4, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Goa, 76 percent use sanitary napkins, 29 percent use cloth, and 24 percent use locally prepared napkins. Overall, 89 percent of women age 15-24 use a hygienic method of menstrual protection. Women in urban areas (94\%) are more likely than women in rural areas ( $82 \%$ ) to use a hygienic method of menstrual protection.

## Employment and earnings

Only 26 percent of all women age 15-49 were employed in the 12 months preceding the survey; in the same period, 80 percent of all men age 15-49 were employed. Among employed women, 91 percent earned cash, including 1 percent whose earnings were in both cash and kind, and 9 percent were not paid at all. Almost all men who were employed earned cash. Eighty-five percent of employed women worked in a non-agricultural occupations, compared with 96 percent of employed men.

## Only 26 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, 94 percent decide how their earnings will be used, either alone or jointly with their husband. Over two-fifths (42\%) of women who work for cash say that they earn more or about the same as their husband.

## Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Between 87 and 91 percent say that they alone or jointly with their husband participate in decisions about their own health care, making major household purchases, and visits to their own family and relatives. Overall, 84 percent of currently married women participate in making all three of these decisions, and only 6 percent do not participate in making any of the three decisions. Participation in all three decisions varies most by schooling, increasing from 73 percent among women with no schooling to 93 percent among women with 12 or more years of schooling.

Currently married men were also asked who makes decisions about their own health care and major household purchases. Ninety-four percent of men reported that they alone or jointly with their wife participate in decisions about major household purchases. Notably, men were less likely than women to report that they alone or jointly with their wife participate in decisions about their own health ( $82 \%$ versus $91 \%$ ).

## Other indicators of women's empowerment

More than three-fifths ( $62 \%$ ) of women have some money that they can decide how to use. The proportion of women with money which they control increases sharply with age, and is higher among women who are employed for cash $(85 \%)$ than any other group of women.

## More than four-fifths (83\%) of women have a bank or savings account that they themselves use.

More than four-fifths ( $83 \%$ ) of women have a bank or savings account that they themselves use. This percentage is highest, at 94 percent, among women who have 12 or more years of schooling. Women's knowledge and use of microcredit programmes is limited. Fifty-six percent of women know of a microcredit programme in the area, but only 4 percent have ever taken a loan from a microcredit programme.

Fifty-eight percent of women are allowed to go by themselves to all three of the following places: the market, a health facility, and places outside the village/community. The proportion of women who are allowed to go to all three places alone varies sharply with age (from $34 \%$ for women age 15-19 to $73 \%$ for women age 40-49). A higher proportion of women who are employed $(73 \%)$ are allowed to go to all three places alone than women who are not employed (53\%).

## Ownership of assets

Thirty-three percent of women and 51 percent of men age 15-49 own a house alone or jointly with someone else, and 14 percent of women and 25 percent of men own land alone or jointly with someone else. Ownership of land is more common in rural than urban areas for both women and men.

Thirty-three percent of women own a house alone or jointly with someone else, and 14 percent of women own land alone or jointly with someone else.

Over four-fifths ( $81 \%$ ) of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use 91 percent can read SMS messages. The percentage of women who have a mobile phone that they themselves use increases with the level of schooling.

Eighty-one percent of women have a mobile phone that they themselves use.

## Gender-role attitudes

Twenty-one percent of women believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to believe that wife beating is justified if a woman shows disrespect for her in-laws (13\%), followed by if she neglects the house or children (12\%). Men are less likely to agree: 13 percent say that wife beating is justified in some circumstances, especially if the wife shows disrespect for in-laws ( $8 \%$ ) or if she neglects the house or children (6\%). Even among women and men who have completed at least 12 years of schooling, 14 percent of women and 8 percent of men say that a husband is justified in beating his wife for one or more of the specified reasons.

Sixty-nine percent of women and 72 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. Eighty-one percent of men agree that if a wife refuses to have sex with her husband he does not have a right to get angry and reprimand her, to refuse to give her financial support, to use force to have sex even if she doesn't want to, or to have sex with another woman.

## Domestic Violence

Among women age 15-49, 12 percent have ever experienced physical violence and 1 percent have ever experienced sexual violence. In all, 13 percent of women in Goa have experienced physical or sexual violence. Among those who experienced physical violence since age 15, the most common perpetrator for ever-married women was the husband ( $88 \%$ ).

## Thirteen percent of women age 15-49 in Goa have ever experienced physical or sexual violence.

## Violence during pregnancy

Two percent of women who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies.

## Spousal violence

Eleven percent of ever-married women report ever having been slapped by their husband; 2-3 percent report being pushed, shaken, or having something thrown at them; having their arm twisted or hair pulled; being punched; or being kicked, dragged, or beaten up. Less than 1 percent have been choked or burned on purpose, or threatened or attacked with a knife, gun, or other weapon. One percent report that their husband forced them with threats or other ways to perform sexual acts they did not want to perform.

Overall, 13 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Five percent report spousal emotional violence. Few ever-married women (2\%) have ever initiated violence against their husband.

Although the prevalence of spousal violence is lower among more educated women, 4 percent of women who have at least 12 years of schooling have experienced physical or sexual spousal violence.

More than one-fifth (21\%) of women who have ever experienced spousal physical or sexual violence have suffered injuries as a result of the violence. The most common type of injury is cuts, bruises, or aches.

Is alcohol use related to spousal physical or sexual violence?
Percentage of currently married women experiencing violence

Note: Category "Husband drinks, but never gets drunk" not shown since there are fewer than 25 unweighted cases.

## Help seeking

Only 10 percent of women who have ever experienced physical or sexual violence by anyone have ever sought help. Seventy-three percent of women have neither sought help nor told anyone about the violence.

na $=$ Not applicable
${ }^{1}$ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.
${ }^{2}$ Protected dug well, protected spring, rainwater, community RO plant
${ }^{3}$ Surface water, unprotected dug well, unprotected spring, cart with small tank, tanker truck, bottled water
${ }^{4}$ Total may add to more than 100.0 because households may use more than one method of purification
${ }^{5}$ Appropriate water treatment methods include boiling, bleaching, filtering, and electronic purifying
${ }^{6}$ Includes ventilated improved pit (VIP)/biogas latrine and twin pit/composting toilet
${ }^{7}$ Facilities that would be considered improved if they were not shared by two or more households
${ }^{8}$ Includes dry toilet
${ }^{9}$ Houses made from mud, thatch, or other low-quality materials are called kachha houses, houses that use partly low-quality and partly high-quality materials are called semi-pucca houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called pucca houses.
${ }^{10}$ Electricity, LPG/natural gas, or biogas
${ }^{11}$ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes
${ }^{12}$ Frequency of smoking by anyone inside the house

Table 5 Household possessions and land ownership
Percentage of urban, rural, and total households and de jure population possessing various household goods, means of transport, agricultural land, a house and farm animals and having a bank/post office account, health scheme/health insurance, a BPL card, and a long-lasting insecticide-treated (LLIN) mosquito net, Goa, 2015-16

| Household possessions | Urban | Rural | Total | De jure population |

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status. All modern methods includes users of pills, IUDs or PPIUDs, and injectables, who are not shown separately.
UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare $U H C=$ Urban health centre; UHP $=$ Urban health post; UFWC $=$ Urban family welfare centre; $C H C=$ Community health centre; PHC $=$ Primary health centre;
ANM $=$ Auxiliary nurse midwife
${ }^{1}$ Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods
() Based on 25-49 unweighted cases

* Percentage not shown; based on few

Table 27 Twelve-month contraceptive discontinuation rates
Among women age 15-49 who started an episode of contraceptive use within the five years preceding the survey, the percentage of episodes discontinued within 12 months, by reason for discontinuation and specific method, Goa, 2015-16

| Method | Reason for discontinuation |  |  |  |  |  |  |  | Switched to another method $^{4}$ | Number of episodes of use ${ }^{5}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Method failure | Desire to become pregnant | Other fertility related reason ${ }^{1}$ | Side effects/ health concerns | Wanted more effective method | Other method related reason ${ }^{2}$ | Other <br> reason | $\begin{gathered} \text { Any } \\ \text { reason } \end{gathered}$ |  |  |
| All modern spacing methods ${ }^{6}$ | (0.0) | (12.1) | (7.2) | (9.6) | (0.0) | (2.7) | (26.6) | (58.2) | (1.4) | 133 |
| All spacing methods ${ }^{7}$ | (0.0) | (12.1) | (8.2) | (8.9) | (2.2) | (2.9) | (25.3) | (59.5) | (2.7) | 152 |
| All methods | 0.0 | 9.8 | 6.6 | 7.1 | 1.7 | 2.3 | 20.1 | 47.7 | 2.2 | 192 |

Note: Figures are based on life table calculations using information on episodes of contraceptive use that began 3-62 months preceding the survey. All methods includes female sterilization, pill, IUD/PPIUD, condom/Nirodh, withdrawal, rhythm, and other methods, which are not shown separately
${ }^{1}$ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation
${ }^{2}$ Includes lack of access/too far, costs too much, and inconvenient to use
${ }^{3}$ Reasons for discontinuation are mutually exclusive and add to the total in this column
${ }^{4}$ The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within two months of discontinuation.
${ }^{5}$ Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation
${ }^{6}$ Includes pill, IUD/PPIUD, and condom/Nirodh
${ }^{7}$ Includes pill, IUD.PPIUD, condom/Nirodh, withdrawal, rhythm, and other spacing methods
( ) Based on 25-49 unweighted cases

Table 28 Men's contraception-related perceptions and knowledge
Percentage of men age 15-49 who agree with two specific statements about women and contraception, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Goa, 2015-16

| Background characteristic | Percentage of men who agree |  | Percentage of men who say that if a male condom is used correctly, it protects against pregnancy: |  |  |  |  | Number of men |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Total | 8.3 | 9.2 | 17.5 | 3.4 | 22.9 | 26.3 | 11.7 | 32.1 | 43.8 | 60.0 | 56.5 | 1,115 | Note: Total includes women age 15-19 and women who belonging to "other" religions, who are not shown separately. Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.

1 Total demand is the sum of unmet need and met need
${ }^{2}$ Percentage of demand satisfied is met need divided by total demand
${ }^{3}$ Modern methods include female sterilization, male sterilization, pill, IUD/PPIUD, injectables, male condom, female condom, standard days method, diaphragm, foam/jelly, lactational amenorrhoea method (LAM), and other modern methods

Table 30 Unmet need for family planning by district
Percentage of currently married women age 15-49 with unmet need for family planning by district, Goa, 2015-16 and total for NFHS-3

|  | Total <br> unmet need | Unmet need <br> for spacing | Unmet need <br> for limiting | Number <br> of women |
| :--- | :---: | :---: | :---: | :---: |
| District | 18.4 | 9.2 | 9.2 | 672 |
| North Goa | 16.1 | 6.8 | 9.3 | 444 |
| South Goa | 17.5 | 8.3 | 9.2 | 1,115 |
| Goa | 15.2 | 7.5 | 7.7 | 2,143 |

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.

Table 31 Pregnancy outcome
Percent distribution of last pregnancies among women age 15-49 during the five years preceding the survey by pregnancy outcome, according to background characteristics, Goa, 2015-16

|  | Pregnancy outcome |  |  |  |  |  |

[^4]Table 34 Early childhood mortality rates
Neonatal, postneonatal, infant, child, and under-five mortality rates for fiveyear periods preceding the survey and for 0-4 years before NFHS-3, NFHS-2 and NFHS-1, by residence, Goa, 2015-16

| Years <br> preceding <br> the survey | Neonatal <br> mortality <br> $(\mathrm{NN})$ | Postneonatal <br> mortality <br> $(\mathrm{PNN})$ | Infant <br> mortality <br> $\left({ }_{1} \mathrm{q}_{0}\right)$ | Child <br> mortality <br> $\left({ }_{4} \mathrm{q}_{1}\right)$ | Under-five <br> mortality <br> $\left({ }_{5} \mathrm{q}_{0}\right)$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| 0-4 | $(12.9)$ | $(0.0)$ | $(12.9)$ | $(0.0)$ | $(12.9)$ |
| $5-9$ | $(12.6)$ | $(4.9)$ | $(17.6)$ | $(3.2)$ | $(20.8)$ |
| 10-14 | $(12.2)$ | $(12.3)$ | $(24.5)$ | $(3.6)$ | $(28.0)$ |
|  |  |  |  |  |  |
| NFHS-3 (0-4) | 8.8 | 6.5 | 15.3 | 5.0 | 20.3 |
| NFHS-2 (0-4) | 31.2 | 5.5 | 36.7 | 10.5 | 46.8 |
| NFHS-1 $(0-4)$ | 20.6 | 11.3 | 31.9 | 7.2 | 38.9 |

${ }^{1}$ Computed as the difference between the infant and neonatal mortality rates.
( ) Based on 250-499 unweighted person-years of exposure to the risk of death

Table 36 High-risk fertility behaviour
Percent distribution of children born in the five years preceding the survey by category of elevated risk of mortality and the risk ratio, and percent distribution of currently married women by category of risk if they were to conceive a child at the time of the survey, Goa, 2015-16

| Risk category | Births in the 5 years preceding the survey |  | Percentage of currently married women ${ }^{1}$ |
| :---: | :---: | :---: | :---: |
|  | Percentage of births | Risk <br> ratio |  |
| Not in any high-risk category | 32.4 | 1.0 | $33.0^{\text {a }}$ |
| Unavoidable risk category |  |  |  |
| First order births between ages 18 and 34 years | 42.3 | 0.5 | 7.2 |
| Single high-risk category |  |  |  |
| Mother's age <18 | 0.8 | * | 0.0 |
| Mother's age > 34 | 9.8 | (0.0) | 38.6 |
| Birth interval $<24$ months | 9.2 | (1.2) | 4.8 |
| Birth order $>3$ | 2.5 | * | 3.0 |
| Subtotal | 22.3 | 0.5 | 46.3 |
| Multiple high-risk category |  |  |  |
| Mother's age >34 and birth interval <24 months | 0.5 | * | 1.5 |
| Mother's age $>34$ and birth order $>3$ | 1.4 | * | 10.7 |
| Mother's age $>34$ and birth interval $<24$ months and birth order $>3$ | 0.4 | * | 0.4 |
| Birth interval $<24$ months and birth order $>3$ | 0.7 | * | 1.0 |
| Subtotal | 3.0 | * | 13.5 |
| In any avoidable high-risk category | 25.3 | 0.4 | 59.8 |
| Total | 100.0 | na | 100.0 |
| Number of births | 415 | na | 1,115 |
| Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category. <br> na $=$ Not applicable <br> ${ }^{1}$ Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or greater than 34 years and 2 months, latest birth less than 15 months ago, or latest birth of order 3 or higher <br> ${ }^{a}$ Includes sterilized women <br> ( ) Based on 25-49 unweighted cases <br> * Based on fewer than 25 unweighted cases |  |  |  |

Table 37 Antenatal care
Percent distribution of women who had a live birth in the five years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth and percentage receiving ANC from a skilled provider, according to background characteristics, Goa, 2015-16
$\left.\begin{array}{lllllll}\hline & & & & & & \begin{array}{c}\text { Percentage } \\ \text { receiving }\end{array} \\ \text { ANC from }\end{array}\right)$

Note: If more than one source of ANC was mentioned, only the provider with the highest qualification is considered in this table. Total includes women age <15-19, women with births of order 4 and more, women with no schooling or with less than 5 years of schooling, women belonging to "other" religions and scheduled caste women, who are not shown separately.
ANM = Auxiliary nurse midwife; LHV = Lady health visitor; ICDS = Integrated Child Development Services
${ }^{1}$ Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife and lady health visitor"
${ }^{2}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
( ) Based on 25-49 unweighted cases

Table 38 Antenatal care services and information received
Percentage of women who had a live birth in the five years preceding the survey who received antenatal care (ANC) for the most recent live birth by services and information received, according to residence and source of antenatal care, Goa, 2015-16

| Services/information | Residence |  | Source of ANC |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Urban | Rural | Public <br> health <br> sector | Private health sector ${ }^{1}$ | ANC received only at home |  |
| Percentage receiving selected services during antenatal care |  |  |  |  |  |  |
| Weighed | 99.3 | 99.1 | 100.0 | 99.1 | 96.9 | 99.3 |
| Blood pressure measured | 98.6 | 99.5 | 98.8 | 100.0 | 96.9 | 99.0 |
| Urine sample taken | 98.7 | 99.5 | 99.7 | 98.8 | 96.9 | 99.0 |
| Blood sample taken | 100.0 | 96.9 | 97.8 | 100.0 | 100.0 | 98.9 |
| Abdomen examined | 100.0 | 99.1 | 99.4 | 100.0 | 100.0 | 99.7 |
| Percentage receiving information on specific pregnancy complications |  |  |  |  |  |  |
| Vaginal bleeding | 80.2 | 70.9 | 77.3 | 88.2 | 44.5 | 76.8 |
| Convulsions | 76.6 | 73.6 | 74.2 | 89.0 | 44.5 | 75.5 |
| Prolonged labour | 77.8 | 74.8 | 74.6 | 92.1 | 44.8 | 76.7 |
| Severe abdominal pain | 78.5 | 74.7 | 76.3 | 90.1 | 46.3 | 77.1 |
| High blood pressure | 79.7 | 79.2 | 79.1 | 92.7 | 47.9 | 79.5 |
| Where to go if experienced pregnancy complications | 81.2 | 74.6 | 83.5 | 83.4 | 46.8 | 78.8 |
| Number of women | 216 | 123 | 175 | 122 | 46 | 339 |

Table 39 Antenatal care indicators
Among women with a live birth in the five years preceding the survey, percentage who received different types of antenatal care (ANC) during the pregnancy for their most recent live birth, by background characteristics, Goa, 2015-16

| Background characteristic | Percentage who had four or more ANC visits | Percentage with an ANC visit in the first trimester of pregnancy | Percentage who received two or more TT injections during the pregnancy | Percentage whose last live birth was protected against neonatal tetanus ${ }^{1}$ | Percentage who were given or bought IFA | Percentage who took IFA for at least 100 days | Percentage who had full antenatal care ${ }^{2}$ | Percentage who took an intestinal parasite drug |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age at birth |  |  |  |  |  |  |  |  |  |
| 20-34 | 88.3 | 84.4 | 88.4 | 96.0 | 93.4 | 67.4 | 63.1 | 55.9 | 290 |
| 35-49 | (92.5) | (83.3) | (91.5) | (96.4) | (96.2) | (71.1) | (67.9) | (69.7) | 45 |

| Scheduled tribe | (83.8) | (72.8) | (79.0) | (85.8) | (87.5) | (58.0) | (51.9) | (45.8) | 26 |
| Other backward class | 87.8 | 84.0 | 88.3 | 95.2 | 97.6 | 64.4 | 61.1 | 59.5 | 89 |
| Other ${ }^{3}$ | 89.5 | 85.6 | 92.7 | 98.3 | 94.3 | 70.9 | 66.4 | 60.6 | 213 |
| Total | 89.0 | 84.4 | 89.3 | 96.2 | 93.9 | 67.4 | 63.4 | 58.1 | 349 |

Note: Total includes women age 15-19, women with births of birth order 4 or more, women with no schooling or less than 5 years of schooling, women belonging to "other" religions and scheduled caste women, who are not shown separately.
TT = Tetanus toxoid; IFA = Iron and folic acid
${ }^{1}$ Includes mothers with two injections during the pregnancy for her last birth, or two or more injections (the last within 3 years of the last live birth), or three or more injections (the last within 5 years of the last birth), or four or more injections (the last within 10 years of the last live birth), or five or more injections at any time prior to the last birth
${ }^{2}$ Full antenatal care includes having received at least four antenatal care visits, having received at least one TT injection, and having taken IFA tablets or syrup for 100 or more days
${ }^{3}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
() Based on 25-49 unweighted cases

Table 40 Antenatal care indicators by district
Among women with a live birth in the five years preceding the survey, percentage who received different types of antenatal care (ANC) during the pregnancy for their most recent live birth, and among women with registered pregnancies, percentage who received a Mother and Child Protection Card (MCP Card), by district, Goa, 2015-16

| District | Percentage who had four or more ANC visits | Percentage with an ANC visit in the first trimester of pregnancy | Percentage who took IFA for at least 100 days | Percentage who received two or more TT injections during the pregnancy | Percentage who had full antenatal care ${ }^{1}$ | Number of women | Percentage of women who received an MCP Card | Number of registered pregnancies |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| North Goa | 93.9 | 92.6 | 88.6 | 91.5 | 82.9 | 211 | 96.5 | 199 |
| South Goa | 81.5 | 71.9 | 35.3 | 86.0 | 33.7 | 139 | 95.9 | 119 |
| Goa | 89.0 | 84.4 | 67.4 | 89.3 | 63.4 | 349 | 96.3 | 318 |

[^5]Table 41 Advice received during pregnancy
Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, percentage who received different types of advice, by background characteristics, Goa, 2015-16
$\left.\begin{array}{lcccccc}\hline & & & & & & \begin{array}{c}\text { Number of } \\ \text { women who }\end{array} \\ \text { met with a }\end{array}\right)$

Note: Total includes women age 15-19, women with births of birth order 4 or more, women with no schooling or less than 5 years of schooling, Muslim women, women belonging to "other" religions, scheduled caste or scheduled tribe women, who are not shown separately.
${ }^{1}$ Community health worker includes auxiliary nurse midwife (ANM), lady health visitor (LHV), Accredited Social Health Activist (ASHA), anganwadi worker, and other community health worker
${ }^{2}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
() Based on 25-49 unweighted cases
Table 42 Pregnancies for which an ultrasound test was done
Percentage of all pregnancies in the five years preceding the survey for which an ultrasound test was done and percent distribution of pregnancies with an ultrasound test by pregnancy outcome, according to background characteristics, Goa, 2015-16

| Background characteristic | Percentage of pregnancies with an ultrasound test | Number of pregnancies | Pregnancy outcome ${ }^{1}$ |  |  |  | Total percent | Number of pregnancies with an ultrasound test |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Other backward class | 91.9 | 89 | 93.1 | 6.9 | 89.8 | 82 |
| Other ${ }^{1}$ | 90.8 | 213 | 94.7 | 5.3 | 98.7 | 194 |
| Total | 91.0 | 349 | 93.8 | 6.2 | 96.3 | 318 |

Note: Total includes births to women age 15-19, births of order 4 or more, women with no schooling or less than 5 years of schooling, women belonging to "other" religions and scheduled caste women, who are not shown separately.
${ }^{1}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
() Based on 25-49 unweighted cases

## Table 44 Delivery and postnatal care

Percent distribution of live births in the five years preceding the survey by place of delivery and assistance during delivery, percentage delivered by a skilled provider and by caesarean section, and percent distribution of women giving birth in the five years preceding the survey by timing and type of provider of the first postnatal check of the mother for their most recent live birth, by residence, Goa, 2015-16

| Delivery and postnatal care descriptors | Urban | Rural | Total |
| :---: | :---: | :---: | :---: |
| Place of delivery |  |  |  |
| Health facility | 95.8 | 98.8 | 96.9 |
| Public sector | 57.3 | 59.9 | 58.2 |
| Private sector | 38.5 | 38.9 | 38.7 |
| At home | 4.2 | 1.2 | 3.1 |
| Own home | 3.3 | 1.2 | 2.6 |
| Parent's home | 0.9 | 0.0 | 0.6 |
| Total | 100.0 | 100.0 | 100.0 |
| Assistance during delivery ${ }^{2}$ |  |  |  |
| Doctor | 90.2 | 88.9 | 89.7 |
| ANM/nurse/midwife/LHV | 7.3 | 6.3 | 6.9 |
| Other health personnel | 0.0 | 2.3 | 0.8 |
| Dai (TBA) | 0.9 | 1.2 | 1.0 |
| Friends/relatives | 1.3 | 1.2 | 1.2 |
| No one | 0.4 | 0.0 | 0.3 |
| Total | 100.0 | 100.0 | 100.0 |
| Percentage of all births delivered by a skilled provider ${ }^{3}$ | 97.5 | 97.6 | 97.5 |
| Percentage of home births delivered by a skilled provider ${ }^{3}$ | 2.8 | 0.0 | 1.8 |
| Percentage delivered by caesarean section | 33.5 | 27.7 | 31.4 |
| Percentage delivered by emergency caesarean section ${ }^{4}$ | 17.6 | 10.3 | 15.0 |
| Number of births | 268 | 147 | 415 |
| Timing after delivery of mother's first postnatal check ${ }^{5}$ |  |  |  |
| Less than 4 hours | 89.5 | 86.3 | 88.3 |
| 4-23 hours | 1.4 | 0.8 | 1.2 |
| 1-2 days | 2.0 | 4.8 | 3.1 |
| Don't know ${ }^{1}$ | 0.5 | 0.0 | 0.3 |
| No postnatal check | 6.5 | 8.1 | 7.1 |
| Total | 100.0 | 100.0 | 100.0 |
| Type of provider of mother's first postnatal check ${ }^{5}$ |  |  |  |
| Doctor | 83.9 | 85.3 | 84.4 |
| ANM/nurse/midwife/LHV | 9.6 | 5.2 | 8.0 |
| Dai (TBA) | 0.0 | 0.5 | 0.2 |
| Other | 0.0 | 0.9 | 0.3 |
| No postnatal check | 6.5 | 8.1 | 7.1 |
| Total | 100.0 | 100.0 | 100.0 |
| Number of last live births | 221 | 128 | 349 |

ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA $=$ Traditional birth attendant
${ }^{1}$ Includes missing
${ }^{2}$ If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table
${ }^{3}$ Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel
${ }^{4}$ A caesarean section for which the decision to have the operation was made after the onset of labour
${ }^{5}$ Based on the last live birth in the five years preceding the survey. Postnatal checks are checks on the woman's health within 42 days of the birth

Table 45 Delivery and postnatal care by background characteristics
Percentage of live births in the five years preceding the survey delivered in a health facility and percentage delivered with assistance from health personnel, and percentage of women who had a live birth in the five years preceding the survey who received a postnatal check and who received a postnatal check within two days of birth for their most recent birth, by background characteristics, Goa, 2015-16

| Background characteristic | Percentage of births delivered in a public health facility | Percentage of births delivered in a private health facility | Percentage of births delivered in a health facility | Percentage of deliveries assisted by health personnel ${ }^{1}$ | Number of births | Percentage of women with a postnatal check ${ }^{2,3}$ | Percentage of women with a postnatal check within two days of birth ${ }^{2,3}$ | Number of women |

| Public health facility | 100.0 | 0.0 | 100.0 | 98.8 | 242 | 92.1 | 91.5 | 202 |
| Private health facility ${ }^{4}$ | 0.0 | 100.0 | 100.0 | 98.8 | 161 | 95.6 | 95.6 | 141 |
| Total | 58.2 | 38.7 | 96.9 | 97.5 | 415 | 92.9 | 92.6 | 349 |

Note: Total includes births of women age 15-19, births of birth order 4 or more, births to women with no antenatal care visits or who don't know the number of antenatal care visits, births to women belonging to "other" religions, and births delivered at home, which are not shown separately.
${ }^{1}$ Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.
${ }^{2}$ Based on the last live birth in the five years preceding the survey
${ }^{3}$ Postnatal checks are checks on the woman's health within 42 days of the birth
${ }^{4}$ Includes nongovernmental organizations or trust hospitals/clinics
() Based on 25-49 unweighted cases

* Percentage not shown; based on fewer than 25 unweighted cases

Table 46 Delivery and postnatal care by district
Percentage of live births in the five years preceding the survey delivered in a health facility, percentage delivered with assistance from health personnel and percentage delivered by caesarean section, and percentage of women who had a live birth in the five years preceding the survey who received a postnatal check within two days of birth for their most recent birth, by district, Goa, 2015-16

|  | Percentage <br> of births <br> delivered <br> in a public <br> health facility | Percentage <br> of births <br> delivered <br> in a private <br> health facility | Percentage <br> of births <br> delivered <br> in a <br> health facility | Percentage <br> of deliveries <br> assisted <br> by health <br> personnel | Percentage <br> of births <br> delivered by <br> caesarean <br> section | Number <br> of births | Percentage <br> of women with <br> a postnatal <br> check within <br> two days <br> of birth | Number <br> of <br> women |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| District |  | 39.3 | 98.6 | 99.0 | 32.9 | 242 | 95.0 | 211 |
| North Goa | 59.3 | 37.8 | 94.5 | 95.4 | 29.3 | 173 | 88.9 | 139 |
| South Goa | 56.7 | 37.3 |  |  |  |  |  |  |
| Goa | 58.2 | 38.7 | 96.9 | 97.5 | 31.4 | 415 | 92.6 | 349 |

${ }^{1}$ Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.
${ }^{2}$ Postnatal checks are checks on the woman's health within 42 days of the birth.

Table 47 Delivery costs and financial assistance
The average out-of-pocket cost paid for delivery for the most recent live birth among women who had a live birth in the five years preceding the survey that was delivered in a health facility by type of facility, and among women who had a live birth in the five years preceding the survey for the most recent birth that was delivered in a health facility, the percentage who received financial assistance under Janani Suraksha Yojana (JSY), according to background characteristics, Goa, 2015-16

| Background characteristic | Average cost (Rs.) ${ }^{1}$ |  |  | Percentage who received financial assistance under JSY | Number of births in a health facility |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Public health facility | Private health facility | Any health facility |  |  |
| Mother's age at birth |  |  |  |  |  |
| 20-34 | 4,572 | 22,899 | 12,152 | 7.6 | 279 |
| 35-49 | $(12,699)$ | $(28,236)$ | $(21,929)$ | (0.0) | 43 |
| Birth order |  |  |  |  |  |
| 1 | 5,286 | 24,005 | 13,807 | 8.3 | 189 |
| 2-3 | 4,896 | 23,356 | 12,115 | 6.3 | 144 |
| Residence |  |  |  |  |  |
| Urban | 4,372 | 24,875 | 13,224 | 6.8 | 216 |
| Rural | 6,017 | 21,550 | 12,143 | 8.4 | 128 |
| Schooling |  |  |  |  |  |
| 5-9 years complete | 4,304 | 23,298 | 8,698 | 13.2 | 89 |
| 10-11 years complete | 4,964 | 24,512 | 13,277 | 11.2 | 84 |
| 12 or more years complete | 5,690 | 23,740 | 17,649 | 2.8 | 127 |
| Religion |  |  |  |  |  |
| Hindu | 5,586 | 20,361 | 11,157 | 8.8 | 232 |
| Muslim | $(3,263)$ | $(25,192)$ | $(7,286)$ | (9.1) | 41 |
| Christian | 3,905 | 28,874 | 20,635 | 1.6 | 67 |
| Caste/tribe |  |  |  |  |  |
| Scheduled tribe | $(2,662)$ | $(23,560)$ | $(6,862)$ | (12.4) | 25 |
| Other backward class | 6,325 | 18,639 | 11,891 | 4.8 | 89 |
| Other ${ }^{2}$ | 5,000 | 25,152 | 13,486 | 7.4 | 210 |
| Total | 5,012 | 23,701 | 12,820 | 7.4 | 343 |

Note: Total includes births with mother's age at birth 15-19, births of order 4 or more, births to women with no schooling or less than 5 years of schooling, births to women belonging to "other" religions, and births to scheduled caste women, which are not shown separately.
${ }^{1}$ Excludes women who don't know the cost
${ }^{2}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
() Based on 25-49 unweighted cases

## Table 48 Birth order and delivery characteristics by district

Percentage of births during the three years preceding the survey of birth order 3 or more, percentage of women who had a live birth in the five years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth and among women who had a live birth in the five years preceding the survey for the most recent birth that was delivered in a health facility, the percentage of women who received financial assistance under Janani Suraksha Yojana (JSY) by district, Goa, 2015-16

| District | Percentage of births of birth order 3 or more | Number of births | Percentage of last births receiving antenatal care from doctor | Percentage of last births receiving antenatal care from ANM/nurse/ midwife/LHV | Number of last births | Percentage of births in a health facility receiving financial assistance under JSY | Number of births in a health facility |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| North Goa | 15.0 | 146 | 87.9 | 25.9 | 211 | 8.1 | 209 |
| South Goa | 30.3 | 100 | 86.6 | 20.7 | 139 | 6.2 | 135 |
| Goa | 21.3 | 246 | 87.4 | 23.8 | 349 | 7.4 | 343 |

ANM = Auxiliary nurse midwife; LHV = Lady health visitor

Table 49 Timing of first health check after birth for the newborn
Percent distribution of last births in the five years preceding the survey by time after birth of first health check, and the percentage of births with a health check in the first two days after birth, according to background characteristics, Goa, 2015-16

| Background characteristic | Time after birth of newborn's first health check |  |  |  |  | No health check ${ }^{1}$ | Total | Percentage of births with a health check in the first two days after birth | Number of births |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Less than 1 hour | 1-3 <br> hours | $4-23$ <br> hours | $\begin{gathered} 1-2 \\ \text { days } \end{gathered}$ | $\begin{gathered} 3-6 \\ \text { days } \end{gathered}$ |  |  |  |  |

[^6]Table 50 Trends in maternal care indicators
Maternal care indicators for births during the three years preceding the survey by residence, NFHS-4 and NFHS-3, Goa.

| Indicator | $\begin{gathered} \text { NFHS-4 } \\ (2015-16) \end{gathered}$ | $\begin{gathered} \text { NFHS-3 } \\ (2005-06) \end{gathered}$ |
| :---: | :---: | :---: |
| URBAN |  |  |
| Percentage who received antenatal care ${ }^{1}$ | 96.5 | 98.5 |
| Percentage who had at least four antenatal care visits ${ }^{1}$ | 89.2 | 94.5 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 84.1 | 89.5 |
| Percentage who received full antenatal care ${ }^{1,2}$ | 65.7 | 71.6 |
| Percentage of births delivered in a health facility ${ }^{3}$ | 97.6 | 92.7 |
| Percentage of deliveries assisted by health personnel ${ }^{3,4}$ | 99.3 | 94.7 |
| RURAL |  |  |
| Percentage who received antenatal care ${ }^{1}$ | 94.5 | 95.4 |
| Percentage who had at least four antenatal care visits ${ }^{1}$ | 86.7 | 90.4 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 82.1 | 84.7 |
| Percentage who received full antenatal care ${ }^{1,2}$ | 59.7 | 45.2 |
| Percentage of births delivered in a health facility ${ }^{3}$ | 98.6 | 92.4 |
| Percentage of deliveries assisted by health personnel ${ }^{3,4}$ | 97.2 | 93.8 |
| TOTAL |  |  |
| Percentage who received antenatal care ${ }^{1}$ | 95.8 | 97.1 |
| Percentage who had at least four antenatal care visits ${ }^{1}$ | 88.3 | 92.7 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 83.4 | 87.4 |
| Percentage who received full antenatal care ${ }^{1,2}$ | 63.6 | 60.0 |
| Percentage of births delivered in a health facility ${ }^{3}$ | 97.9 | 92.6 |
| Percentage of deliveries assisted by health personnel ${ }^{3,4}$ | 98.6 | 94.3 |

[^7]Table 51 Male involvement in maternal care: Men's report
Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present for at least one antenatal check-up, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Goa, 2015-16

| Antenatal and delivery care information | Urban | Rural | Total |
| :---: | :---: | :---: | :---: |
| Percentage of men for whom the youngest child's mother received antenatal care | 100.0 | 100.0 | 100.0 |
| Percentage of men who were present at any antenatal check-up | 100.0 | 90.6 | 96.2 |
| Percentage who were told by a health provider or worker about the following signs of pregnancy complications: |  |  |  |
| Vaginal bleeding | 95.2 | 79.0 | 88.7 |
| Convulsions | 94.9 | 78.0 | 88.1 |
| Prolonged labour | 97.5 | 86.9 | 93.2 |
| Severe abdominal pain | 98.3 | 88.9 | 94.5 |
| High blood pressure | 93.4 | 86.5 | 90.6 |
| Percentage ever told what to do if the mother had any pregnancy complications | 95.7 | 79.6 | 89.2 |
| Percentage whose youngest child age 0-35 months was delivered in a health facility | 100.0 | 96.6 | 98.6 |
| Percentage to whom a health provider or worker spoke about the following aspects of maternal care: |  |  |  |
| The importance of delivering in a health facility | 99.1 | 86.3 | 94.0 |
| The importance of proper nutrition for the mother during pregnancy | 99.1 | 96.4 | 98.0 |
| Family planning or delaying his next child | 100.0 | 92.5 | 97.0 |
| Number of men with a youngest child age 0-35 months | 78 | 53 | 131 |

Table 52 Vaccinations by background characteristics
Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report) and percentage with a vaccination card
seen by the interviewer, by background characteristics, Goa, 2015-16, and total for NFHS-3
Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report) and percentage with a vaccination card
seen by the interviewer, by background characteristics, Goa, 2015-16, and total for NFHS-3

| Child's living arrangements |  |  |  |  |  |  |  |  |  |  |  |  |
| Living with both parents | 9.2 | 20.7 | -0.9 | 9.5 | 21.1 | 3.7 | -0.9 | 6.0 | 24.1 | 0.9 | -1.1 | 333 |
| Living with one or neither parent | (5.8) | (14.9) | (-0.2) | (9.8) | (28.1) | (3.7) | (-0.8) | (1.5) | (22.0) | (0.0) | (-0.7) | 40 |
| Total | 8.8 | 20.1 | -0.8 | 9.5 | 21.9 | 3.7 | -0.9 | 5.5 | 23.8 | 0.8 | -1.1 | 373 |
| NFHS-3 (2005-06) | 10.2 | 25.6 | -1.1 | 5.6 | 14.1 | 4.3 | -0.7 | 6.7 | 25.0 | 1.9 | -1.1 | 793 |

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards adopted in 2006. The indices in this table are NOT comparable to those based on the previously used 1977 NCHS/CDC/WHO Reference. Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Total includes children age 6-11 months, children of birth order 4 or more, children whose size at birth is very small or whose birth size is not known, children belonging to "other" religions, scheduled caste children, and children whose mother's nutritional status is missing, who are not shown separately.
${ }^{1}$ Recumbent length is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm ; standing height is measured for all other children ${ }^{2}$ Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median
Excludes children whose mothers were not interviewed
4 First born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval
${ }^{5}$ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
${ }^{6}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months.
Mother's nutritional status in terms of BMI (Body Mass Index) is presented in Table 70.

Table 61 Initial breastfeeding
Among last-born children who were born in the two years preceding the survey, the percentage who were ever breastfed, and the percentage who started breastfeeding within one hour and one day of birth, and among last-born children born in the two years preceding the survey who were ever breastfed, the percentage who received a prelacteal feed, by background characteristics, Goa, 2015-16

| Background characteristic | Among last-born children born in the past two years: |  |  |  | Among last-born children born in the past two years who were ever breastfed: |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Percentage ever breastfed | Percentage who started breastfeeding within one hour of birth ${ }^{1}$ | Percentage who started breastfeeding within one day of birth ${ }^{2}$ | Number of last-born children | Percentage who received a prelacteal feed ${ }^{3}$ | Number of last-born ever breastfed children |
| Residence |  |  |  |  |  |  |
| Urban | 97.5 | 74.2 | 93.8 | 104 | 7.2 | 101 |
| Rural | 96.8 | 77.7 | 91.7 | 52 | 12.2 | 50 |
| Sex |  |  |  |  |  |  |
| Male | 97.8 | 71.5 | 93.7 | 80 | 11.6 | 78 |
| Female | 96.7 | 79.4 | 92.3 | 76 | 5.9 | 74 |
| Total | 97.3 | 75.4 | 93.1 | 156 | 8.8 | 152 |

Note: Table is based on last-born children born in the past two years whether the children are living or dead at the time of interview.
${ }^{1}$ Includes children who started breastfeeding immediately after birth
${ }^{2}$ Includes children who started breastfeeding within one hour of birth
${ }^{3}$ Children given something other than breast milk during the first three days of life
Table 62 Breastfeeding status by age
Percent distribution of youngest children under two years living with the mother by breastfeeding status, percentage currently breastfeeding, and percentage of all children under two years using a bottle with a nipple, according to age in months, Goa, 2015-16

| Age in months | Not breastfeeding | Exclusively breastfed | Breastfeeding and consuming: |  |  |  |  | Percentage currently breastfeeding | Number of youngest children under two years living with the mother | Percentage using a bottle with a nipple | Number of all children under two years |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Plain water only | Non-milk liquids/juice | Other milk | Complementary foods | Total |  |  |  |  |
| 12-17 | (24.3) | (11.9) | (4.0) | (0.0) | (2.9) | (56.9) | 100.0 | (75.7) | 35 | (30.1) | 36 |
| 18-23 | (33.5) | (0.8) | (10.1) | (0.0) | (2.2) | (53.5) | 100.0 | (66.5) | 46 | (36.7) | 49 |
| <6 | (3.4) | (60.9) | (8.9) | (0.0) | (17.7) | (9.1) | 100.0 | (96.6) | 40 | (18.5) | 40 |
| 6-9 | (2.0) | (19.3) | (6.7) | (2.2) | (29.5) | (40.3) | 100.0 | (98.0) | 27 | (51.5) | 27 |
| 12-15 | (20.7) | (13.7) | (5.7) | (0.0) | (4.2) | (55.8) | 100.0 | (79.3) | 24 | (27.2) | 25 |
| 12-23 | 29.5 | 5.5 | 7.5 | 0.0 | 2.5 | 54.9 | 100.0 | 70.5 | 81 | 33.9 | 85 |
| 20-23 | (34.2) | (0.0) | (15.0) | (0.0) | (3.4) | (47.5) | 100.0 | (65.8) | 31 | (27.2) | 33 |

Note: Breastfeeding status refers to a "24-hour" period (yesterday and last night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements.
The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus children who receive breastmilk and non-milk liquids and who do not receive other milk and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding () Based on 25-49 unweighted cases

Table 64 Child feeding practices and nutritional status of children by district
Among last-born children in the past 2 years, percentage breastfed within one hour of birth, percentage of youngest children under age 6 months living with mother who are exclusive breastfed, and percentage of children under age five years classified as malnourished according to three anthropometric indices of nutritional status: height-for-age, weight-for-height, and weight-for-age, by district, Goa, 2015-16

|  | Among last-born children in the past 2 years |  | Percentage of children under age |  | Height-for-age ${ }^{2}$ | Weight-for-height | Weight-for-age |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| District | Percentage breastfed within one hour of birth | Number of children | 6 months exclusively breastfed ${ }^{1}$ | Number of children | Percentage below $-2 S D^{3}$ | Percentage below $-2 \mathrm{SD}^{3}$ | Percentage below $-2 \mathrm{SD}^{3}$ | Number of children |
| North Goa | 87.3 | 90 | * | 26 | 21.4 | 17.5 | 23.8 | 212 |
| South Goa | 59.0 | 66 | * | 15 | 18.3 | 27.7 | 23.9 | 161 |
| Goa | 75.4 | 156 | (60.9) | 40 | 20.1 | 21.9 | 23.8 | 373 |

${ }^{1}$ Based on the youngest child living with the mother
${ }^{2}$ Recumbent length is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm ; standing height is measured for all other children.
${ }^{3}$ Based on the WHO Child Growth Standards population median
( ) Based on 25-49 unweighted cases

* Percentage not shown; based on fewer than 25 unweighted cases

Table 65 Prevalence of anaemia in children
Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Goa, 201516, and total for NFHS-3

| Background characteristic | Anaemia status by haemoglobin level |  |  | Any anaemia ( $<11.0 \mathrm{~g} / \mathrm{dl}$ ) | Number of children |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mild $(10.0-10.9 \mathrm{~g} / \mathrm{dl})$ | $\begin{gathered} \text { Moderate } \\ (7.0-9.9 \mathrm{~g} / \mathrm{dl}) \end{gathered}$ | $\begin{gathered} \text { Severe } \\ (<7.0 \mathrm{~g} / \mathrm{dl}) \\ \hline \end{gathered}$ |  |  |
| Age in months |  |  |  |  |  |

## Table 65 Prevalence of anaemia in children-Continued

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Goa, 2015-16 and total for NFHS-3

| Background characteristic | Anaemia status by haemoglobin level |  |  | $\begin{gathered} \text { Any } \\ \text { anaemia } \\ (<11.0 \mathrm{~g} / \mathrm{dl}) \end{gathered}$ | Number of children |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { Mild } \\ (10.0-10.9 \mathrm{~g} / \mathrm{dl}) \end{gathered}$ | Moderate $(7.0-9.9 \mathrm{~g} / \mathrm{dl})$ | $\begin{gathered} \text { Severe } \\ (<7.0 \mathrm{~g} / \mathrm{dl}) \end{gathered}$ |  |  |
| Mother's anaemia status ${ }^{4}$ |  |  |  |  |  |
| Not anaemic | 28.7 | 18.7 | 0.5 | 48.0 | 221 |
| Mildly anaemic | 34.0 | 16.0 | 0.5 | 50.6 | 114 |
| Moderately/severely anaemic | (21.5) | (22.0) | (0.0) | (43.5) | 27 |
| Total | 29.8 | 18.1 | 0.5 | 48.3 | 362 |
| NFHS-3 (2005-06) | 19.5 | 17.1 | 1.5 | 38.2 | 661 |

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre ( $\mathrm{g} / \mathrm{dl}$ ). Total includes children of birth of order 4 or more, children belonging to "other" religions and scheduled caste children, who are not shown separately.
${ }^{1}$ Excludes children whose mothers were not interviewed
${ }^{2}$ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
${ }^{3}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
${ }^{4}$ Mildly anaemic is classified as 10.0-11.9 $\mathrm{g} / \mathrm{dl}$ for non-pregnant women and $10.0-10.9 \mathrm{~g} / \mathrm{dl}$ for pregnant women. Moderately/ severely anaemic is $<10.0 \mathrm{~g} / \mathrm{dl}$. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known.
() Based on 25-49 unweighted cases
Table 66 Micronutrient intake among children
Percentage of youngest children age 9-23 months living with the mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children
Table 66 Micronutrient intake among children
Percentage of youngest children age 9-23 months living with the mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children
 seven days, who were given deworming medication in the six months preceding the survey, and who live in households using iodized salt, by background characteristics, Goa, 2015-16, and total for NFHS-3

Table 66 Micronutrient intake among children-Continued
Percentage of youngest children age 9-23 months living with the mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children
 total for NFHS-3

|  | Youngest children age 9-23 months living with their mother |  |  | Children age 9-59 months |  | Children age 6-59 months |  |  | Children age 6-59 month in households with salt tested |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Background characteristic | Percentage who consumed foods rich in vitamin A in past 24 hours $^{1}$ | Percentage who consumed foods rich in iron in past 24 hours $^{2}$ | Number of children | Percentage given vitamin A supplements in past 6 months | Number of children | Percentage given iron supplements in past 7 days | Percentage given deworming medication in past 6 months $^{3}$ | Number of children | Percentage <br> living in households using iodized salt ${ }^{4}$ | Number of children |
| Religion |  |  |  |  |  |  |  |  |  |  |
| Hindu | 39.0 | 19.0 | 63 | 89.8 | 231 | 58.0 | 67.5 | 243 | 97.3 | 246 |
| Muslim | * | * | 14 | (88.8) | 58 | 38.0 | 63.1 | 61 | (100.0) | 57 |
| Christian | * | * | 17 | 88.9 | 59 | 61.8 | 62.2 | 64 | 98.0 | 67 |
| Caste/tribe |  |  |  |  |  |  |  |  |  |  |
| Scheduled tribe | * | * | 8 | (86.5) | 29 | (51.9) | (67.2) | 30 | (90.5) | 33 |
| Other backward class | (38.4) | (18.4) | 25 | 91.3 | 83 | 48.9 | 66.5 | 90 | 98.3 | 97 |
| Other ${ }^{5}$ | 44.7 | 28.5 | 59 | 90.3 | 218 | 56.8 | 63.3 | 229 | 99.0 | 221 |
| Total | 42.3 | 24.7 | 96 | 89.5 | 349 | 55.5 | 65.6 | 369 | 97.9 | 371 |
| NFHS-3 (2005-06) | 75.8 | 43.8 | 236 | 31.0 | 831 | 16.7 | 57.1 | 894 | 78.6 | 974 |

Note: Information on iron supplements and deworming medication is based on the mother's recall. Information on vitamin A supplementation is based on the vaccination card (where available) and mother's recall. Total includes children age 6-11 months, births of birth order 4 or more, children belonging to "other" religions and scheduled caste children, who are not shown separately
${ }^{1}$ Includes meat and organ meats, fish, poultry, eggs, pumpkin, carrots, squash, and sweet potatoes that are yellow or orange inside, dark green leafy vegetables, ripe mango, papaya, cantaloupe, and ${ }^{2}$ Includes meat and organ meats, fish, poultry, or eggs ${ }^{3}$ Deworming for intestinal worms
${ }^{4}$ Excludes children in households in which salt was not tested. Includes children whose mothers were not interviewed, except for birth order breastfeeding status and mother's schooling. For mother's schooling, excludes children whose mothers are not listed in the household schedule.
5 Not belonging to a scheduled caste, scheduled tribe, or other backward class
() Based on 25-49 unweighted cases

[^10]Table 67 Presence of iodized salt in household
Percentage of households with salt tested for iodine content that have iodized salt, according to background characteristics, Goa, 2015-16, and total for NFHS-3

|  | Among households with <br> tested salt: |  |
| :--- | :---: | :---: |
|  | Percentage with <br> iodized salt | Number <br> of households |
| Background characteristic |  |  |
|  |  | 1,015 |
| Residence | 97.6 | 572 |
| Urban | 92.5 |  |
| Rural |  | 1,073 |
| Religion of household head | 95.7 | 124 |
| Hindu | 99.6 | 384 |
| Muslim | 94.4 |  |
| Christian |  | 97 |
|  | 94.1 | 113 |
| Caste/tribe of household head | 89.9 | 382 |
| Scheduled caste | 96.0 | 993 |
| Scheduled tribe | 96.4 | 1,587 |
| Other backward class | 95.7 | 3,200 |
| Other |  |  |
| Total |  |  |

Note: Total includes households in which the household heads belongs to "other" religions or does not know their caste/tribe, who are not shown separately.

Table 68 Presence of iodized salt in household by district
Percentage of households with salt tested for iodine content that have iodized salt, by district, Goa, 2015-16.

|  | Among households with tested salt: |  |
| :--- | :---: | :---: |
| District | Percentage with <br> iodized salt | Number of <br> households |
| North Goa | 94.5 | 924 |
| South Goa | 97.4 | 662 |
| Goa | 95.7 | 1,587 |

Table 69 Women's and men's food consumption
Percent distribution of women and men age 15-49 by frequency of consumption of specific foods, Goa, 2015-16

| Caste/tribe |  |  |  |  |  |  |  |  |  |
| Scheduled caste | (1.7) | (46.1) | (52.2) | (1.7) | (0.0) | (0.0) | 100.0 | (0.0) | 48 |
| Scheduled tribe | 14.1 | 35.0 | 54.7 | 6.7 | 3.5 | 0.0 | 100.0 | 2.7 | 58 |
| Other backward class | 14.3 | 35.6 | 51.1 | 11.5 | 1.6 | 0.1 | 100.0 | 0.3 | 230 |
| Other | 16.7 | 36.7 | 48.1 | 11.7 | 3.5 | 0.0 | 100.0 | 0.9 | 420 |
| Total age 15-49 | 14.9 | 36.8 | 49.8 | 10.7 | 2.7 | 0.0 | 100.0 | 0.8 | 758 |
| Age 50-54 | 41.5 | 27.3 | 46.5 | 16.6 | 5.7 | 3.9 | 100.0 | 6.1 | 87 |
| Total age 15-54 | 17.6 | 35.8 | 49.4 | 11.3 | 3.0 | 0.4 | 100.0 | 1.3 | 845 |

Note: Total includes men who have completed less than 5 years of schooling, men belonging to "other" religions, and men who don't know their caste/tribe, who are not shown separately. SBP = Systolic blood pressure; DBP = Diastolic blood pressure
${ }^{1}$ A man is classified as having hypertension if he has blood $\mathrm{SBP} \geq 140 \mathrm{mmHg}$ or $\mathrm{DBS} \geq 90 \mathrm{mmHg}$ at time of survey, or he is currently taking antihypertension medication to control his blood
pressure. The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

[^16]Table 101 Help seeking
Percentage of women age 15-49 who have ever experienced physical or sexual violence by whether they have ever sought help, Goa, 2015-16
Help seeking Percentage

| Never sought help and never told anyone | 72.5 |
| :--- | :--- |
| Never sought help but told someone | 17.6 |
| Sought help | 10.0 |

Number of women who experienced violence

## Appendix

## ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fourth National Family Health Survey (NFHS-4) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-4 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS4 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-4 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, $r=y / x$, where $y$ represents the total sample value for variable $y$, and $x$ represents the total number of cases in the group or subgroup under consideration. The variance of $r$ is computed using the formula given below, with the standard error being the square root of the variance:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1-f}{x^{2}} \sum_{h=1}^{H}\left[\frac{m_{h}}{m_{h}-1}\left(\sum_{i=1}^{m_{h}} z_{h i}^{2}-\frac{z_{h}^{2}}{m_{h}}\right)\right]
$$

in which

$$
z_{h i}=y_{h i}-r x_{h i}, \text { and } z_{h}=y_{h}-r x_{h}
$$

where $h$ represents the stratum, which varies from 1 to $H$,
$m_{h}$ is the total number of clusters selected in the $h^{\text {th }}$ stratum,
$y_{h i}$ is the sum of the weighted values of variable $y$ in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum, is the sum of the weighted number of cases in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum, and is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-4 sample for Goa, there were 76 clusters. Hence, 76 replications were created. The variance of a rate r is calculated as follows:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1}{k(k-1)} \sum_{i=1}^{k}\left(r_{i}-r\right)^{2}
$$

in which

$$
r_{i}=k r-(k-1) r_{(i)}
$$

where $r$ is the estimate computed from the full sample of 76 clusters,
$r_{(i)}$ is the estimate computed from the reduced sample of 75 clusters ( $\mathrm{i}^{\text {th }}$ cluster excluded), and
$k \quad$ is the total number of clusters.
In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ) for each estimate are also computed.

Sampling errors for NFHS-4 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Goa as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A. 2 presents the value of the statistic (R), its standard error (SE), the number of unweighted ( N ) and weighted ( WN ) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ); for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1 ).

| Variable | Estimate | Base population |
| :---: | :---: | :---: |
| HOUSEHOLDS |  |  |
| Using an improved source of drinking water | Proportion | Households |
| Using an improved sanitation facility | Proportion | Households |
| Using iodized salt | Proportion | Households |
| Sex ratio (females per 1,000 males) | Ratio | De facto household population, all ages |
| WOMEN |  |  |
| No schooling (Females age 6 years and above) | Proportion | De facto household population of females age 6 and above |
| Urban residence | Proportion | Women age 15-49 |
| No schooling (Women age 15-49) | Proportion | Women age 15-49 |
| Completed 10 or more years of schooling | Proportion | Women age 15-49 |
| Never married, including married gauna not performed | Proportion | Women age 15-49 |
| Currently married | Proportion | Women age 15-49 |
| Married before age 18 | Proportion | Women age 20-49 |
| Currently using any contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using a modern contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using a traditional contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using pill | Proportion | Currently married women age 15-49 |
| Currently using IUD/PPIUD | Proportion | Currently married women age 15-49 |
| Currently using condom/Nirodh | Proportion | Currently married women age 15-49 |
| Currently using female sterilization | Proportion | Currently married women age 15-49 |
| Using public medical sector source of contraception | Proportion | Women age 15-49 currently using modern methods of contraception |
| Unmet need for family planning | Proportion | Currently married women age 15-49 |
| Want no more children | Proportion | Currently married women age 15-49 |
| Want to delay next birth at least 2 years | Proportion | Currently married women age 15-49 |
| Mother received four or more antenatal care (ANC) visits | Proportion | Women with at least one birth in last five years (last birth) |
| Took iron and folic acid (IFA) for 100 days or more | Proportion | Women with at least one birth in last five years (last birth) |
| Birth registration | Proportion | De jure children under age 5 years |
| Births delivered by a health personnel | Proportion | Births in last 5 years |
| Institutional delivery | Proportion | Births in last 5 years |
| Postnatal check for mother within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Postnatal check for newborn within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Exclusive breastfeeding | Proportion | Children under age 6 months |
| Children with diarrhoea | Proportion | Children under age 5 years |
| Treated with oral rehydration salt (ORS) packets | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Children with diarrhoea taken to a health provider | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Child received BCG vaccination | Proportion | Children age 12-23 months |
| Child received DPT vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received polio vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received measles vaccination | Proportion | Children age 12-23 months |
| Child received hepatitis B vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child with all basic vaccinations | Proportion | Children age 12-23 months |
| Children given vitamin A supplement in past 6 months | Proportion | Children age 9-59 months |
| Height-for-age, stunting (below-2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-height, wasting (below-2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-age, underweight (below -2SD) | Proportion | Children under age 5 years who were measured |
| Children with any anaemia | Proportion | Children age 6-59 months with an anaemia test |
| Women with any anaemia | Proportion | Women age 15-49 with an anaemia test |
| Body mass index (BMI) $<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women age 15-49 who were measured |
| Body mass index (BMI) $\geq 25.0 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women age 15-49 who were measured |
| Have heard of HIVIAIDS | Proportion | Women age 15-49 |
| Have comprehensive knowledge about HIV/AIDS | Proportion | Women age 15-49 |
| Ever experienced physical or sexual violence | Proportion | Women age 15-49 |
| Total fertility rate (last 3 years) | Rate | Women |
| Neonatal mortality | Rate | Births in last 5 years |
| Postneonatal mortality | Rate | Births in last 5 years |
| Infant mortality | Rate | Births in last 5 years |
| Child mortality | Rate | Births in last 5 years |
| Under-five mortality | Rate | Births in last 5 years |
| MEN |  |  |
| No schooling (Males age 6 years and above) | Proportion | De facto household population of males age 6 and above |
| Urban residence | Proportion | Men age 15-49 |
| No schooling (Men age 15-49) | Proportion | Men age 15-49 |
| Completed 10 or more years of schooling | Proportion | Men age 15-49 |
| Never married, including married gauna not performed | Proportion | Men age 15-49 |
| Currently married | Proportion | Men age 15-49 |
| Married before age 21 | Proportion | Men age 25-49 |
| Want no more children | Proportion | Currently married men age 15-49 |
| Want to delay next birth at least 2 years | Proportion | Currently married men age 15-49 |
| Men with any anaemia | Proportion | Men age 15-49 with an anaemia test |
| Body mass index (BMI) $<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Men age 15-49 who were measured |
| Body mass index (BMI) $\geq 25.0 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Men age 15-49 who were measured |
| Have heard of HIVIAIDS | Proportion | Men age 15-49 |
| Have comprehensive knowledge about HIV/AIDS | Proportion | Men age 15-49 |

[^17]

Technical assistance for NFHS-4 was provided by the USAID-supported DHS Program at ICF, and assistance for the HIV components was provided by NACO and NARI. Funding assistance was provided by Ministry of Health and Family Welfare, Government of India and: BILL MELINDA
GATES foundation
Gicef
$\because: \because$ NN앙
MacArthur Foundation

The opinions in this publication do not necessarily reflect the views of the funding agencies.
For additional information on NFHS-4, visit http://www.rchiips.org/nfhs
For related information, visit http://www.iipsindia.org or http://www.mohfw.nic.in

[^0]:    BPL = Below poverty line
    ${ }^{1}$ Cows, bulls, buffaloes, camels, horses, donkeys, mules, goats, sheep, chickens, or ducks
    ${ }^{2}$ Percentage of households in which any usual member of the household has a bank account/post office account
    ${ }^{3}$ Percentage of households in which any usual member of the household is covered by a health scheme/health insurance

[^1]:    ( ) Based on 25-49 unweighted cases

    * Not shown; based on fewer than 25 unweighted cases

[^2]:    Note: Total includes women/men with 5 or more children, who are not shown separately.
    ${ }^{1}$ Includes current pregnancy of woman/wife
    ${ }^{2}$ Means are calculated excluding respondents who gave non-numeric responses
    ( ) Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^3]:    Note: Total includes men who have less than 5 years of schooling, men belonging to "other" religions, and men who don't know their caste/tribe, who are not shown separately.
    ${ }^{1}$ Includes missing values and those who have never heard of male condoms
    () Based on 25-49 unweighted cases

[^4]:    = Omitted because less than 50 percent of the women or men were married, began living with their spouse, or had sexual intercourse for the first time before reaching the beginning of the age group.

[^5]:    $\mathrm{TT}=$ Tetanus toxoid; IFA = Iron and folic acid
