## InTRODUCTION

The 2015-16 National Family Health Survey (NFHS-4), the fourth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. For the first time, NFHS-4 provides district-level estimates for many important indicators. All four NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-4 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation (BMGF), UNICEF, UNFPA, the MacArthur Foundation, and the Government of India. Technical assistance for NFHS-4 was provided by ICF, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires - household, woman's, man's, and biomarker-were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-4. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, and treatment of childhood illnesses, was fielded in the entire sample of NFHS-4 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-4 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV / AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, haemoglobin, blood pressure, and random blood glucose for women age 15-49 years and men age 15-54 years, and the collection of finger-stick blood for HIV testing in a laboratory. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-4 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 640 districts in India, as of the 2011 Census). The total sample size of approximately 572,000 households for India was based on the size needed to produce reliable indicator estimates for each district and for urban and rural areas in districts in which the urban population accounted for 30-70 percent of the total district population. The rural sample was selected through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected
with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

The figures of NFHS-4 and earlier rounds may not be strictly comparable due to differences in sample size, and NFHS-4 will be a benchmark for future surveys. NFHS-4 fieldwork for Meghalaya was conducted in all 7 districts of the state from 6 April to 19 September, 2015 by Nielsen (India) Private Limited, and collected information from 7,327 households, 9,201 women age 15-49 (including 1,461 women interviewed in PSUs in the state module), and 1,236 men age 15-54. Survey response rates were 98 percent for households, 97 percent for women, and 91 percent for men.

This report presents the key findings of the NFHS-4 survey in Meghalaya, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

## Household Characteristics

## Household composition

In Meghalaya, 22 percent of households are in urban areas. On average, households are comprised of 5.1 members. Thirty percent of households are headed by women, with 29 percent of the population living in female-headed households.

A large majority of households in Meghalaya have household heads who are Christian (77\%). Eleven percent of households have household heads who are Hindu and 5 percent of household have Muslim household heads.

Eighty-eight percent of households in Meghalaya have household heads who belong to a scheduled tribe, and 3 percent belong to a scheduled caste. Seven percent of Meghalaya's household heads do not belong to scheduled castes, scheduled tribes, or other backward classes.

More than one-third (37\%) of Meghalaya's population is under age 15; only 3 percent is age 65 and over. The overall sex ratio of the population is 1,005 females per 1,000 males, and the sex ratio of the population under seven years of age is 991 females per 1,000 males. Less than one percent of persons have an Aadhaar card.

Among children below 18 years of age, 8 percent have experienced the death of one or both parents. In all, 83 percent of children below 18 years of age live with both parents, 13 percent live with one parent (mostly with their mother), and the remaining 4 percent live with neither parent. Births of four-fifths of children under five years of age were registered with the civil authorities, but only 47 percent of children have a birth certificate.

## Housing characteristics

Less than half ( $43 \%$ ) of households in Meghalaya live in a рисса house, while a very large majority of households ( $91 \%$ ) have electricity. Only 8 percent of households do not use a sanitation facility, which means that household members practice open defecation, a substantial improvement from 29 percent at the time of NFHS-3. Open defecation is more common among rural households ( $10 \%$ ) than urban households ( $0.5 \%$ ).

## Only 24 percent of households in Meghalaya have water piped into their dwelling, yard, or plot.

Sixty-eight percent of households use an improved source of drinking water, but only 24 percent have water piped into their dwelling, yard, or plot. Urban households (58\%) are more likely than rural households ( $15 \%$ ) to have water piped into their dwelling, yard, or plot. Almost two-thirds ( $65 \%$ ) of households treat their drinking water to make it potable (mostly by boiling). Three-fourths of the households in Meghalaya use solid fuel for cooking (mainly wood), more so in the rural areas ( $89 \%$ ). Only 22 percent of households use a clean fuel for cooking.

## Selected household possessions

Almost all urban households (98\%) and most rural households (87\%) in Meghalaya have a mobile phone. Seventy-nine percent of households have a bank or post office account. BPL cards are held by 20 percent of households, up from 10 percent in NFHS-3. Seventy-two percent own a house, but the proportion is much less in urban areas ( $46 \%$ ). Agricultural land is owned by 34 percent of rural households and 8 percent of urban households. Overall, 28 percent of all households in Meghalaya own agricultural land. More than half (56\%) of the households own farm animals, including 13 percent of urban households.

## Education

## School attendance among children

About 90 percent of children age 6-17 years in Meghalaya attend school ( $94 \%$ in urban areas and $87 \%$ in rural areas). School attendance is almost universal (94\%) at age 6-14 years, and then drops to 75 percent at age $15-17$ years. There is almost no gender disparity in school attendance in the 6-14 year age group; however, in the age group 15-17 years, more girls (77\%) than boys (72\%) are attending school.
 school attendance?
Percentage of children attending school by age

## Literacy, educational attainment, and media exposure

In NFHS-4, literate persons are those who have either completed at least standard six or passed a simple literacy test conducted as part of the survey. According to this measure, 83 percent of women age 15-49 and 84 percent of men age 15-49 are literate.

## Only 19 percent of women age 15-49 in Meghalaya have completed 12 or more years of schooling, compared with 22 percent of men.

Sixteen percent of both women and men age 15-49 have never been to school. Only 19 percent of women age 15-49 in Meghalaya have completed 12 or more years of schooling, compared with 22 percent of men.

Media exposure is moderate among women and men in Meghalaya. More than 7 in 10 women and men watch television at least once a week. Men (44\%) are much more likely than women
$(31 \%)$ to read a newspaper or magazine at least once a week. Twenty-four percent of women and 18 percent of men are not regularly exposed to any form of media.

## Fertility

## Age at first marriage

The median age at first marriage is 21.7 years among women age 25-49 years. Seventeen percent of women age 20-24 years got married before the legal minimum age of 18, down from 25 percent in NFHS-3. Fourteen percent of men age 25-29 years got married before the legal minimum age of 21, down from 27 percent of men in NFHS-3.

## Fertility levels

The total fertility rate (TFR) in Meghalaya is 3.0 children per woman, nearly one child above replacement level fertility. Fertility decreased by nearly 0.8 children in the seven years between NFHS-2 and NFHS-3, and declined further by 0.8 children in the 10 years between NFHS-3 and NFHS-4.

Fertility in urban areas, at 1.7 children per woman, is well below replacement level but fertility is more than one child ( 1.4 children) above the replacement level in rural areas ( 3.5 children per woman). Among births in the three years preceding the survey, 33 percent were of birth order four or higher, compared with 39 percent in NFHS-3.

Fertility Trends
Total fertility rate (children per woman)

There are large differentials in fertility by religion, caste/tribe, residence and schooling. At current fertility rates, women with no schooling will have 2.3 children more than women who had 12 or more years of schooling (a TFR of 4.3, compared with 1.9). Hindu women have the lowest TFR (1.5), followed by Christian women (3.1), Muslim women (3.6), and women from other religions (4.5). Fertility is twice as high in rural areas (TFR of 3.5) than in urban areas (1.7). Despite the overall high fertility, the total wanted fertility of women in Meghalaya is slightly lower ( 2.8 children).

How does fertility vary with schooling? Total fertility rate (children per woman)

## Pregnancy outcome

Ninety-five percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining pregnancies terminated in foetal wastage. Miscarriage is the most commonly reported type of foetal wastage, accounting for 4 percent of all pregnancies, followed by abortion and stillbirth.

## Teenage pregnancy

Among young women age 15-19 in Meghalaya, 9 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, about the same as in NFHS-3 (8\%). About 1 percent of women age 15-16 years have started childbearing, but this proportion increases sharply to 14 percent among women who are 18 years old and to 26 percent among women who are 19 years old. Twenty-one percent of women who had no schooling have begun childbearing, compared with only one percent of women with 12 or more years of schooling.

## Birth intervals

The median interval between births in the five years before the survey in Meghalaya is 32.5 months, 0.8 months longer than in NFHS-3. Eight percent of births take place within 18 months of the last birth and 24 percent occur within 24 months. Fifty-nine percent of births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality

Fifty-nine percent of births in Meghalaya occur within three years of the previous birth.

## Fertility preferences

Thirty-six percent of currently married women and 34 percent of currently married men want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, almost two-fifths of women and around half of men would like to wait at least two years before the next birth. Thirty percent of women and 27 percent of men consider the ideal family size to be two or fewer children.

In Meghalaya, being a matriarchal society, there is an indication of a preference for daughters among women. Twenty-one percent of women want more daughters than sons, compared with 14 percent who want more sons than daughters. More men would like to have more sons than daughters $(21 \%)$ than would like to have more daughters than sons ( $18 \%$ ). However, 83 percent of women and 90 percent of men want at least one son and at least one daughter.

Women's desire for more children is strongly affected by their current number of living children, particularly their number of sons. For example, among women with two children, 35 percent with two sons and 34 percent with one son want no more children, compared with only 26 percent with two daughters who want no more children. Notably, however, the proportion of currently married women with two children who want no more children irrespective of their number of sons has decreased somewhat in the 10 years since NFHS-3.

In Meghalaya, there are some unplanned pregnancies. If all women were to have only the number of children they wanted, the total fertility rate would have been 2.8 children per woman, instead of the current level of 3.0 children per woman.

> How does son preference affect women's desire for children?
> Percentage of currently married women with two children who want no more children

- NFHS-3 $\quad$ NFHS-4

## Family Planning

## Contraceptive knowledge and use

Knowledge of contraception is almost universal in Meghalaya. However, some methods are still less well known. Only a little over two-thirds of currently married women know about injectables ( $68 \%$ ) and 20 percent know about female condoms. Among all women, 26 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 24 percent, the same as in NFHS-3. Modern method use is 22 percent, indicating an increase of 3 percentage points from its level in NFHS-3 (19\%). The share of female sterilization in contraceptive method use ( $26 \%$ ) has decreased since NFHS-3 (39\%). During the same period, the share of pill use more than doubled, from 20 percent to 48 percent. Contraceptive use in NFHS-4 increases sharply with age, from 7 percent for women age 15-19 to 23-31 percent for women age 25-49.

How many women use family planning? Percentage of currently married women

In Meghalaya, contraceptive use is higher in urban areas (33\%) than in rural areas (22\%). Contraceptive prevalence does not vary much by the level of schooling. Muslim women (43\%) are much more likely to use contraception than Hindu women (35\%) or Christian women ( $22 \%$ ). Women in Meghalaya are much less likely to use contraception if they have no children (4\%).

The most common modern spacing method used by currently married women in Meghalaya is pills ( $12 \%$ ).

Sixty-eight percent of sterilized women had their sterilization operation in the public sector, mainly in a government or municipal hospital ( $59 \%$ ), and three-fourths of IUD or PPIUD users had their IUD insertion in the public sector. The majority of pill ( $72 \%$ ) and condom/ Nirodh (62\%) users get their supply from the private sector.

The 12-month discontinuation rate for all methods is 36 percent. Thirtyfive percent of users of modern spacing methods discontinued use within the first year after they adopted the method. The most com-

What contraceptive methods do women use? Currently married women
 mon reason for discontinuation is method related issues, followed by the desire to become pregnant.

> More than one-third (35\%) of users of modern spacing methods discontinued use within the first year after they adopted the method.

## Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Seventy-two percent of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use. Only 60 percent were told about the possible side effects or problems with their method, and even fewer ( $50 \%$ ) were told what to do if they experienced any side effects.

## Men's attitudes

Almost one-sixth ( $15 \%$ ) of men age 15-49 in Meghalaya agree that contraception is women's business and a man should not have to worry about it. However, only 13 percent think that women using contraception may become promiscuous. Less than half ( $43 \%$ ) of men know that a condom, if used correctly, protects against pregnancy most of the time.

Contraceptive Prevalence Rate by District Percentage of currently married women

## Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 21 percent of currently married women have an unmet need for family planning, a decline of 14 percentage points since NFHS-3. Currently, 53 percent of the demand for family planning is being satisfied and 48 percent of the demand is being satisfied by modern methods. The percentage of demand for family planning that is satisfied has increased by 13 percentage points in the 10-year period since NFHS-3.

## Infant and Child Mortality

The infant mortality rate in Meghalaya in NFHS-4 is estimated at 30 deaths before the age of one year per 1,000 live births, down from the NFHS-3 estimate of 45, the NFHS-2 estimate of 89, and the NFHS-1 estimate of 64.

In Meghalaya, all infant and child mortality rates are lower for girls than boys. In fact, 1 in 22 boys die before the age of five, compared with 1 in 29 girls. Children born to mothers age 30-39 are more likely to die during infancy than children born to mothers in the prime childbearing age (20-29 years). Infant mortality is 32 per 1,000 for children with mother's age at birth 30-39, compared with 25 per 1,000 for children with mother's age at birth 20-29. Having children too close together is especially risky. Children born less than two years after a previous birth are almost twice as likely to die in infancy as children whose mothers waited four or more years between births.

Trends in Infant Mortality
Deaths per 1,000 live births
■ NFHS-3 - NFHS-4

The neonatal mortality rate is almost five times as high in rural areas as in urban areas, and the infant mortality rate is more than twice as high in rural areas as in urban areas. An even greater differential exists in infant mortality according to mother's schooling. Children whose mothers have no schooling ( 41 per 1,000 live births) are more than three times as likely to die before their first birthday as children whose mothers have completed 10 or more years of schooling ( 12 per 1,000 live births).

High-risk births have higher mortality rates
Deaths in the first year of life per 1,000 live births

Note: Category "Mother's age at birth 40-49" is not shown since there are fewer than 250 unweighted person-years of exposure to the risk of death.

## Maternal Health

## Antenatal care

Among mothers who gave birth in the five years preceding the survey, four-fifths received antenatal care (ANC) for their last birth from a skilled provider ( $62 \%$ from a doctor and $18 \%$ from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Fifteen percent did not receive any antenatal care. Among mothers who gave birth in the five years preceding the survey, 84 percent registered the pregnancy for the most recent live birth. Among the registered pregnancies, 94 percent received a Mother and Child Protection Card (MCP Card).

Just over half (53\%) of women received antenatal care during the first trimester of pregnancy, as is recommended. Half of mothers had four or more antenatal care visits. Urban women were much more likely to receive four or more antenatal care visits than rural women. The proportion of women who received four or more antenatal care visits and the proportion of women who had their first antenatal care visit in the first trimester of pregnancy for their last births have both increased substantially in the 10 years since NFHS-3. For 81 percent of their last births, mothers received iron and folic acid (IFA) supplements, but

Four or More Antenatal Care Visits by District Percentage of last births in the past five years
 only 36 percent consumed them for the recommended 100 days or more. More than three-fourths of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. Only four percent of mothers took an intestinal parasite drug during pregnancy.

## Only half of mothers in Meghalaya received at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, 65-85 percent received advice on each of the five different areas $(85 \%$ on keeping the baby warm, $84 \%$ received advice on breastfeeding, $83 \%$ on the importance of institutional delivery, $71 \%$ on family planning, and $65 \%$ on cord care).

How does appropriate antenatal care vary with schooling? Percentage of last births in the past five years

Even when women receive antenatal care, sometimes they do not receive all the services needed to monitor their pregnancy. In Meghalaya, more than 80 percent of women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their weight taken and their blood pressure measured ( $95 \%$ each), having their abdomen examined $(91 \%)$, and having blood and urine samples taken ( $80-81 \%$ ).

An ultrasound test was performed during one-third of pregnancies in the five years preceding the survey. Women with at least 12 years of schooling were much more likely to have an ultrasound test than women with less schooling or no schooling. Fifty-nine percent of women with at least 12 years of schooling had an ultrasound test compared with 18 percent of women with no schooling. Urban women were two times as likely to have an ultrasound test as rural women. Forty-six percent of Hindu women had an ultrasound test, compared with 33 percent of Christian women.

## Delivery care

Just over half ( $51 \%$ ) of births take place in a health facility (mostly a government facility) and almost half take place at home. The percentage of births in a health facility increased by 22 percentage points in the past 10 years, from 29 percent in NFHS-3 to 51 percent in NFHS-4. Institutional births are more common among women who have received an antenatal check, women with 12 or more years of schooling, women who are having their first birth, women in urban areas, and Hindu women.

For 80 percent of home births, a clean blade was used to cut the cord, as is recommended. A disposable delivery kit was used for 30 percent of deliveries. Seventy-seven percent of home births followed the recommendation that the baby be immediately wiped dry and then wrapped without being bathed first.

Fifty-four percent of births during the past five years took place with assistance from a skilled provider, and another 30 percent were delivered by a traditional birth attendant. Eight percent of births during the past five years were delivered by caesarean section. Almost one-third (30\%) of caesarean sections ( $2 \%$ of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 28 percent received financial assistance under the Janani Suraksha Yojana (JSY). Women who have no schooling were more likely than women with 12 or more years of schooling to receive financial assistance under JSY. Younger women were more likely than older women to receive financial assistance under JSY.

Institutional Delivery by District
Percentage of births in the past five years

## Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Meghalaya, 69 percent of mothers had a postnatal check after their last birth and 56 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common following births in a health facility; 82 percent of births in public health facilities and 90 percent of births in private health facilities were followed by a postnatal check for the mother within two days of birth, compared with only 22 percent of home births.

Only 17 percent of last births in the five years preceding the survey received a health check in the first two days after birth. Nineteen percent of home births received a health check in the first two days after birth.

## Male involvement in maternal care

Eighty-seven percent of men with a child under three years of age said that the youngest child's mother received antenatal care. Forty-three percent of men with a child under three years said they were present during at least one antenatal check-up received by the child's mother ( $57 \%$ in urban areas and $40 \%$ in rural areas), but only one-third of men were told by a health provider or health worker what to do if the mother had a pregnancy complication. Only 24-39 percent of men were told about the signs of specific pregnancy complications (convulsions, vaginal bleeding, prolonged labour, high blood pressure, and severe abdominal pain).

Among fathers with a child less than three years of age, 42-67 percent of fathers were given information about various aspects of maternal care. Sixty-seven percent were told about the importance of proper nutrition for the mother during pregnancy and 63 percent were told about the importance of delivering the baby in a health facility. Forty-two percent were told about family planning or delaying the next child by a health provider or a health worker. Only 37-57 percent of fathers whose child was not delivered in a health facility were told about the importance of cord care, the importance of keeping the baby warm immediately after birth, and the importance of breastfeeding the baby immediately after delivery.

## Child Health

## Vaccination of children

Less than two-thirds ( $62 \%$ ) of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, most children are at least partially vaccinated; 12 percent have not received any vaccinations at all.

Eighty-six percent of children have received a BCG vaccination. However, slightly less than three-quarters have received other basic vaccinations ( $71 \%$ have received at least the recommended three doses of polio vaccine, $72 \%$ have been vaccinated against measles and $74 \%$ have received the three recommended doses of DPT vaccine). There is considerable dropout between the first and third doses of DPT vaccine (from $83 \%$ to $74 \%$ ) and polio vaccine (from $86 \%$ to $71 \%$ ).

Trends in Vaccination Coverage
Percentage of children 12-23 months receiving vaccinations
$\square$ NFHS-1 $\square$ NFHS-2 $\quad$ NFHS-3 $\quad$ NFHS-4

Between NFHS-3 and NFHS-4, there was a large increase in vaccination coverage for three doses of DPT (from $47 \%$ to $74 \%$ ), measles (from $44 \%$ to $72 \%$ ), BCG (from $66 \%$ to $86 \%$ ) and three doses of polio vaccine (from $57 \%$ to $71 \%$ ). Overall, coverage of all basic vaccinations is almost twice as high as it was in NFHS-3 (increasing from $33 \%$ to $62 \%$ ). In addition, more than three-quarters $(77 \%)$ of children have received at least one dose of hepatitis B vaccine, but slightly less than two-thirds ( $63 \%$ ) of children have received all three recommended doses of hepatitis B vaccine.

Coverage with all basic vaccinations is higher in urban areas than in rural areas (81\% versus $59 \%$ ) and is high for children whose mothers have 12 or more years of schooling and for first births. Girls are more likely to be fully vaccinated than boys.

Coverage of All Basic Vaccinations by District
Percentage of children 12-23 months

## Childhood illnesses

In the two weeks before the survey, 6 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related). Of these children, 76 percent were taken to a health facility or health provider.

Twenty-three percent of children under age five were reported to have had fever in the two weeks preceding the survey; 76 percent of these children were taken to a health facility or provider for treatment.

Overall, 11 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Seventy percent of these children were taken to a health facility or health provider. More than 9 out of 10 mothers of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 78 percent of children with diarrhoea were given ORS. Fifty-four percent of children with diarrhoea were given gruel and more than 8 out of 10 children were given some type of oral rehydration therapy (ORT). Fifty-eight percent were given zinc supplements. Six percent of children with diarrhoea did not receive any type of treatment at all.

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Meghalaya only 15 percent of children with diarrhoea received more to drink than normal. Only one-third of children received the same amount to drink as usual. Of greater concern, slightly more than half (52\%) of children with diarrhoea were given less to drink or nothing at all to drink. Only 41 percent of children with diarrhoea were given the same amount of food or more food, as recommended. Sixty-two percent of children with diarrhoea were given ORT and continued feeding.

## Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based anganwadi centres.

Fifty-six percent of children under 6 years receive services of some kind from an anganzadi centre. The most common services that age-eligible children receive are supplementary food ( $56 \%$ ), growth monitoring ( $43 \%$ ), early childhood care or preschool ( $38 \%$ of children age 3-6 years), and health check-ups ( $36 \%$ ). The service that is least likely to be accessed is immunizations $(20 \%)$. Slightly more than half of the mothers of children who were weighed at an anganzwadi centre ( $52 \%$ ) received counselling from an anganwadi worker or an ANM. Among children under 6 years, slightly more than half of their mothers ( $54 \%$ ) received any service from an anganwadi centre during pregnancy, and 51 percent of their mothers received any service while breastfeeding.

How many children received anganwadi centre services?
Percentage of age-eligible children receiving services

## Breastfeeding, Nutrition, and Anaemia

## Infant feeding

Although breastfeeding is nearly universal in Meghalaya, only 36 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Ninety-three percent are put to the breast within the first day of life, but only 61 percent started breastfeeding in the first hour of life (as recommended). While the initiation of breastfeeding indicators shows substantial improvement since NFHS-3, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and exposes the baby to the risk of infection. However, 16 percent of children are given something other than breastmilk during the first three days. Overall, 88 percent of children continue breastfeeding at 1 year and two-thirds ( $67 \%$ ) continue breastfeeding at 2 years. The median duration of breastfeeding is 29.3 months, which is the age to which half of children are breastfed.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. At age 6-8 months two-thirds (67\%) of children in Meghalaya receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and nonbreastfed children. Only about half $(49 \%)$ of children age 6-23 months are fed the recommended minimum number of times per day and even a smaller proportion of children ( $45 \%$ ) are fed from the appropriate number of food groups. Only about one-fourth ( $24 \%$ ) of children are fed according to all three recommended practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Meghalaya, just over half (54\%) of children age 9-59 months were given a vitamin A supplement in the past six months, but more than three-quarters ( $76 \%$ ) of children age 9-23 months ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Sixty-one percent of children age 9-23 months ate iron-rich foods during the day or night before the survey, and 30 percent of children ages 6-59 months were given iron supplements in the week before the survey.

## Children's nutritional status

Over two-fifths ( $44 \%$ ) of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Fifteen percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 7 percent are severely wasted. Twenty-nine percent are underweight, which takes into account both chronic and acute undernutrition. Four percent of children are overweight. Even during the first six months of life, when almost all babies are breastfed, 13 percent of children are stunted, 11 percent are underweight, and 21 percent are wasted.

Children's nutritional status in Meghalaya has improved since NFHS-3. Stunting decreased from 55 percent to 44 percent in the 10 years between NFHS-3 and NFHS-4, and the percentage of children who are underweight decreased from 49 percent to 29 percent. In the same period, wasting decreased from 31 percent to 15 percent. Despite the gains in stunting, wasting and underweight, child malnutrition is still a major problem in Meghalaya.

Trends in Children's Nutritional Status Percentage of children under five years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population the level of undernutrition by the sex of the child or by the child's living arrangements. However, differences are more pronounced for other background characteristics. Undernutrition is higher in rural areas than in urban areas and it generally decreases with increasing mother's schooling, better nutritional status of the mother, and larger child's size at birth. The level of undernutrition is relatively high for Muslim children and children of higher birth orders.

## Adults' nutritional status

Almost one-fourth of women ( $24 \%$ ) and 22 percent of men are either too thin or overweight or obese. Almost the same proportion of men and women are overweight or obese as thin, which is very different from the pattern in NFHS-3, where a substantially larger proportion of men and women were thin than overweight or obese. Twelve percent of men and women each in Meghalaya are too thin, and 10 percent of men and 12 percent of women are overweight or obese. Over three-fourths of women and men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups, among Muslim women, and among scheduled caste women. Overweight and obesity are most prevalent in older adults, those in urban areas, and well-educated men.

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Nearly all households (99\%) in Meghalaya were using iodized salt at the time of the survey, up slightly from 97 percent in NFHS-3.
How many women are at a healthy weight for their height?
Percent distribution of women Percent distribution of women

## Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworm and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Meghalaya, especially among women and children.

Among children between the ages of 6 and 59 months, about two-fifths ( $41 \%$ ) of children are anaemic. This includes 25 percent who are mildly anaemic, 16 percent who are moderately anaemic, and less than 1 percent who suffer from severe anaemia. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. Almost onethirds ( $31 \%$ ) of children are anaemic even if their mother has 12 or more years of schooling.

Anaemia among women, men, and children

Fifty-two percent of women in Meghalaya have anaemia, including 35 percent with mild anaemia, 15 percent with moderate anaemia, and 1 percent with severe anaemia. Anaemia is particularly high for women who are breastfeeding, but anaemia exceeds 38 percent for every group of women. Anaemia among women has increased substantially (by 7 percentage points) since NFHS-3. Almost one-third of men (31\%) are anaemic. Men under age 30 are less likely to be anaemic than older men.

## Adult Health and Health Care

## Tuberculosis

In Meghalaya, 542 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is higher among men (644) than among women (440) and is slightly higher in urban areas (583) than in rural areas (532).

Most respondents have heard of tuberculosis ( $90 \%$ of women and $91 \%$ of men), but even among those who have heard of tuberculosis, only 72 percent of women and 76 percent of men know that it is spread through the air by coughing or sneezing. Over three-fifths of women and men have misconceptions about how tuberculosis is spread. Overall, 88 percent of women and 92 percent of men know that tuberculosis can be cured, and only 14 percent of women and 8 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

Diabetes, asthma, goitre, heart disease, and cancer
According to self-reports, 1,123 women and 4,605 men age 15-49 per 100,000 have diabetes. The prevalence of diabetes is particularly high among older women and men. Overall, 3,002 women and 661 men per 100,000 suffer from asthma. The prevalence of asthma among women is higher among older (age 35-49) and younger (age 15-19) age groups and women who have never been married. Goitre or any other thyroid disorder is somewhat more common than
asthma among men ( 1,750 cases per 100,000 ), but less common than asthma among women ( 2,319 per 100,000). The prevalence of any heart disease is almost twice as high among women $(3,813$ per 100,000$)$ as among men ( 1,950 per 100,000 ). Among the five diseases, cancer is the least common, with 396 women per 100,000 and 121 men per 100,000 reportedly suffering from cancer.

## Blood pressure (hypertension)

Fourteen percent of women age 15-49 in Meghalaya have hypertension, including 7 percent with Stage 1 hypertension, 2 percent with Stage 2 hypertension, 1 percent with Stage 3 hypertension. Three-fifths of women have normal blood pressure, including 3 percent of women with normal blood pressure who are taking medicine to lower their blood pressure. The prevalence of hypertension among men age $15-49$ is about the same as among women. Thirteen percent of men in Meghalaya have hypertension, including 8 percent with Stage 1 hypertension, 2 percent with Stage 2 hypertension, 1 percent with Stage 3 hypertension. A little over half $(52 \%)$ of men have normal blood pressure, including 1 percent of men with normal blood pressure who are taking medicine to lower their blood pressure. For both women and men, hypertension tends to increase with age.

## Blood glucose

NFHS-4 included measurement of random blood glucose among women age 15-49 and men age 15-54. Two percent of women age 15-49 in Meghalaya have high blood glucose levels, and an additional 2 percent have very high blood glucose levels. In comparison, 4 percent of men age 15-49 have high blood glucose levels and an additional 3 percent have very high blood glucose levels. Older women and men, and men with 12 or more years of schooling, have relatively high blood glucose levels.

## Health examinations

In Meghalaya, 20 percent of women have ever undergone an examination of the cervix, 12 percent have ever undergone a breast examination, and 17 percent have ever undergone an examination of the oral cavity.

## Tobacco and alcohol use

Almost 72 percent of men and 32 percent of women age 15-49 use some form of tobacco. Men are much more likely to smoke bidis ( $46 \%$ ) or cigarettes ( $45 \%$ ) than to use other types of tobacco. Women are most likely to use chewing tobacco. Among women and men, the use of any form of tobacco is higher in rural areas than in urban areas, with bidis being especially popular among men in rural areas. Most men who smoke cigarettes or bidis smoked 10 or more cigarettes or bidis in the past 24 hours. Men are less likely to drink alcohol ( $45 \%$ ) than to use tobacco, and only 2 percent of women say that they drink alcohol. Among men who drink alcohol, more than three-fifths drink alcohol at least once a week.

## Source of health care

The public health sector is the main source of health care for more than three-fourths of households, including 83 percent of households in rural areas. Household members are slightly more likely to go to CHCs/rural hospitals/Block PHCs (27\%) than PHCs/additional PHCs (21\%) and government/municipal hospitals (16\%).

## Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, only 35 percent of households in Meghalaya have any kind of health insurance that covers at least one member of the household. Health insurance coverage is more common in rural areas ( $38 \%$ ) than in urban areas ( $23 \%$ ). In Meghalaya, only two types of programmes dominate: the Rashtriya Swasthya Bima Yojana (RSBY) and the State health insurance scheme.

Over one-fourth of women ( $28 \%$ ) and men ( $26 \%$ ) age 15-49 years are covered by any health scheme or health insurance. More women and men residing in rural areas than in urban areas are covered by any health scheme or health insurance. Health scheme or health insurance coverage is higher among women and men age 35-49 and among scheduled tribes.

## HIV/AIDS

## Awareness of HIV or AIDS

Almost four-fifths (79\%) of women in Meghalaya have heard of HIV or AIDS. In urban areas, 91 percent know about HIV or AIDS, compared with 74 percent in rural areas. Young women age 15-24 years are more likely ( $81 \%$ ) than older women to have heard of HIV or AIDS. Women having no schooling (54\%) are less likely than other women to have heard of HIV or AIDS.

Men are slightly more likely than women to know about HIV or AIDS. Over four-fifths (82\%) of men $(82 \%)$ have heard of HIV or AIDS, including 89 percent of men in urban areas.

## Knowledge of prevention and transmission

Men are much more likely than women to know how HIV/AIDS is transmitted and how to keep from getting it. For example, only 47 percent of women know that consistent condom use can help prevent HIV/AIDS, compared with 52 percent of men, and 44 percent of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV / AIDS, compared with 61 percent of men.

Only 13 percent of women and 14 percent of men in Meghalaya have a 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV / AIDS, and they reject two common misconceptions about transmission or prevention of HIV/AIDS.

# Do people know how to prevent HIVIAIDS? <br> Percentage of women and men age 15-49 

## HIV-related stigma

Over two-thirds (68\%) of women and 60 percent of men in Meghalaya would be willing to take care of a relative with HIV/AIDS in their home. A slightly higher proportion of women ( $53 \%$ ) than men ( $45 \%$ ) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Thirty-three percent of women and 29 percent of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Fifty-seven percent of women and 66 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

## HIV testing prior to NFHS-4, blood transfusions, and safe injections

Only 10 percent of women and 2 percent of men age 15-49 had ever been tested for HIV prior to NFHS-4. Women and men in urban areas are somewhat more likely to have ever been tested for HIV prior to NFHS-4 than rural women and men. Seventeen percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Urban women ( $31 \%$ ) are more likely than rural women $(13 \%)$ to have been tested for HIV during ANC.

## Seventeen percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Meghalaya, men (6\%) are slightly more likely than women (4\%) to have ever had a blood transfusion. About one-fourth of women and men received an injection in the past 12 months ( $25 \%$ of women, compared with $23 \%$ of men).

For 98 percent of men and 86 percent of women who received an injection in the past 12 months, a disposable syringe was used.

## Sexual Behaviour

NFHS-4 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

## Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, only 0.4 percent of women and 7 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is almost five times higher in urban areas than in rural areas. Even fewer respondents said that they had multiple sex partners in the past 12 months ( $0.1 \%$ of women and $2 \%$ of men). Only 0.3 percent of men said they had paid for sex in the past year.

## Women's Empowerment

## Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-4, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Meghalaya, most women ( $70 \%$ ) use cloth, 44 percent use sanitary napkins, 24 percent use locally prepared napkins, and 4 percent use tampons. Overall, 64 percent of women age 15-24 use a hygienic method of menstrual protection. Women with at least 10 years of schooling are more than twice as likely to be using a hygienic method as women with no schooling or less than five years of schooling. Notably, only 57 percent of rural women use a hygienic method of menstrual protection, compared with over 85 percent of urban women.

## Employment and earnings

Only 44 percent of all women age $15-49$ were employed in the 12 months preceding the survey; in the same period, 77 percent of all men age 15-49 were employed. Among employed women, 82 percent earned cash (including 17 percent whose earnings were in both cash and in-kind), and 17 percent were not paid at all. Most men who were employed earned cash ( $93 \%$ ), and only 4 percent were not paid at all. Fifty-seven percent of employed women worked in non-agricultural occupations, almost the same proportion as employed men (58\%).

Only 44 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, 90 percent decide how their earnings will be used, either alone or jointly with their husbands. Over one-third (35\%) of women who work for cash say that they earn more or about the same as their husbands. By contrast, 76 percent of currently married men whose wives have cash earnings report that they alone or jointly with their wives decide how her earnings are used, and 20 percent of men who have cash earnings and whose wives have cash earnings say that their wife earns more or about the same as them.

## Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Over four-fifths of women participate in each of the three decisions, namely decisions about their own health care ( $84 \%$ ), decisions about major household purchases ( $84 \%$ ), and decisions about visits to their own family and relatives ( $87 \%$ ). Overall, 77 percent of currently married women participate in making all three of these decisions, and 9 percent do not participate in making any of the three decisions. Participation in all three decisions is uniformly high across different age groups, education groups, urban-rural place of residence, number of living children, and household structure.

Currently married men were also asked who makes decisions about their own health care and major household purchases. Men were more likely than women to report that they alone or jointly with their wife participated in both these decisions: 90 percent participated in making decisions about their own health care and 91 percent participated in decisions about major household purchases.

## Other indicators of women's empowerment

Forty-eight percent of women have some money that they can decide how to use. The proportion of women with money which they control increases sharply with age, and is highest among women with 12 or more years of schooling ( $67 \%$ ) and women who are employed for cash ( $76 \%$ ) than any other group of women.

## Over half of women (54\%) have a bank or savings account that they themselves use.

Over half of women ( $54 \%$ ) have a bank or savings account that they themselves use. This percentage is highest, at 87 percent, among women who have 12 or more years of schooling. Women's knowledge and use of microcredit programmes is very limited. Twenty-two percent of women know of a microcredit programme in the area, and only 4 percent have ever taken a loan from a microcredit programme.

Only 31 percent of women are allowed to go by themselves to all three of the following places: the market, a health facility, and places outside the village/community. The only groups of women in which more than two-fifths are allowed to go to all three places alone are women age 40-49, those having no schooling, those with 3 or more living children, and those from "other" religions.

## Ownership of assets

Fifty-seven percent of women and 59 percent of men own a house alone or jointly with someone else, and 43 percent of women and 46 percent of men own land alone or jointly with someone else. Ownership of both a house and land is more common in rural than urban areas for both women and men.

Fifty-seven percent of women own a house alone or jointly with someone else, and 43 percent of women own land alone or jointly with someone else.

Almost two-thirds ( $64 \%$ ) of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, 85 percent can read SMS messages. Eighty percent of urban women have a mobile phone that they themselves use, compared with 59 percent of rural women. More than two-thirds ( $68 \%$ ) of Christian women have a mobile phone that they themselves use, compared with 58 percent of Hindu women. Rural women who have a mobile phone that they themselves use are much less likely to be able to read SMS messages than urban women who have a mobile phone that they themselves use.

Almost two-thirds (64\%) of women have a mobile phone that they themselves use.

## Gender-role attitudes

Thirty-seven percent of women believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to believe that wife beating is justified if a woman neglects the house or children ( $23 \%$ ), followed by if the husband suspects her of being unfaithful ( $21 \%$ ) and if she argues with him ( $20 \%$ ). Men are more likely to agree: 44 percent say that wife beating is justified in some circumstances, especially if she neglects the house or children ( $32 \%$ ), followed by if she shows disrespect for in-laws ( $29 \%$ ) or if the husband suspects his wife is unfaithful (22\%). Even among women and men who have completed at least 12 years of schooling, more than one in four of women ( $28 \%$ ) and 40 percent of men say that a husband is justified in beating his wife for one or more of the specified reasons.

Fifty percent of women and 52 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. A substantial proportion of men, 60 percent, do not agree that if a wife refuses to have sex with her husband he has a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

## Domestic Violence

Among women age 15-49, 27 percent have ever experienced physical violence and 4 percent have ever experienced sexual violence. In all, 28 percent of women in Meghalaya have experienced physical or sexual violence. Among those who experienced physical violence since age 15 , the most common perpetrator for ever-married women was the husband.

## Over one-fourth (28\%) of women age 15-49 in Meghalaya have experienced physical or sexual violence.

## Violence during pregnancy

Less than 1 percent of women who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies.

## Spousal violence

Twenty-four percent of ever-married women report having been slapped by their husband and 3-8 percent report being pushed, shaken, or having something thrown at them; having their arm twisted or hair pulled; being punched; or being kicked, dragged, or beaten up. Three percent report that their husbands have physically forced them to have sex even when they did not want to and 2 percent report that their husband forced them with threats or other ways to perform sexual acts they did not want to perform. Overall, 29 percent of evermarried women have experienced spousal physical or sexual violence from

Is alcohol use related to spousal physical or sexual violence?
Percentage of ever- married women experiencing violence

Note: Category "Husband drinks alcohol, but never gets drunk" not shown since there are fewer than 25 unweighted cases. their current husband or, if not currently married, from their most recent husband. Eleven percent report spousal emotional violence. Few ever-married women ( $1 \%$ ) have ever initiated violence against their husband.

Although the prevalence of spousal violence is lower among more educated women, almost 1 in 4 women who have at least 12 years of schooling have experienced physical or sexual spousal violence. The contextual and intergenerational aspects of spousal violence are clear from the fact that women whose mothers were beaten by their fathers are almost two and half times as likely to be in abusive marriages themselves. Women whose husbands consume alcohol are much more likely than women whose husbands do not consume alcohol to experience spousal violence, especially if the husband often gets drunk. However, 19 percent of even women whose husbands do not drink alcohol have experienced physical or sexual spousal violence. More than one-quarter of women who have experienced spousal physical or sexual violence have suffered injuries as a result of the violence. The most common type of injury is cuts, bruises, or aches.

## Help seeking

Only 12 percent of women who have ever experienced physical or sexual violence by anyone have sought help. Almost three-fourths ( $74 \%$ ) of women have neither sought help nor told anyone about the violence.

Table 1 Results of the household and individual interviews
Number of households, number of interviews with women and men, and response rates, according to residence, Meghalaya, 2015-16

| Result | Residence |  | Total |
| :---: | :---: | :---: | :---: |
|  | Urban | Rural |  |
| Household interviews |  |  |  |
| Households selected | 1,588 | 5,985 | 7,573 |
| Households occupied | 1,555 | 5,903 | 7,458 |

na $=$ Not applicable
${ }^{1}$ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.
${ }^{2}$ Protected dug well, protected spring, rainwater, community RO plant
${ }^{3}$ Surface water, unprotected dug well, unprotected spring, cart with small tank, tanker truck, bottled water
${ }^{4}$ Total may add to more than 100.0 because households may use more than one method of purification
${ }^{5}$ Appropriate water treatment methods include boiling, bleaching, filtering, and electronic purifying
${ }^{6}$ Includes ventilated improved pit (VIP)/biogas latrine and twin pit/composting toilet
${ }^{7}$ Facilities that would be considered improved if they were not shared by two or more households
${ }^{8}$ Includes dry toilet
${ }^{9}$ Houses made from mud, thatch, or other low-quality materials are called kachha houses, houses that use partly low-quality and partly high-quality materials are called semi-pucca houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called pucca houses.
${ }^{10}$ Electricity, LPG/natural gas, or biogas
${ }^{11}$ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes
${ }^{12}$ Frequency of smoking by anyone inside the house

## Table 5 Household possessions and land ownership

Percentage of urban, rural, and total households and de jure population possessing various household goods, means of transport, agricultural land, a house and farm animals and having a bank/post office account, health scheme/health insurance, a BPL card, and a long-lasting insecticide-treated (LLIN) mosquito net, Meghalaya, 2015-16

[^2]Table 7 Children's living arrangements and orphanhood
Percent distribution of de jure children under age 18 by their living arrangements, and percentage of children with one or both biological parents dead, according to background characteristics, Meghalaya, 2015-16

| Background characteristic | Living with both parents | Living with mother but not with father | Living with father but not with mother | Not living with either parent | Total | Percentage with one or both parents dead ${ }^{1}$ | Number of children |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age |  |  |  |  |  |  |  |
| <5 years | 88.8 | 9.7 | 0.4 | 1.1 | 100.0 | 2.8 | 4,335 |
| 5-9 years | 87.4 | 9.6 | 1.3 | 1.7 | 100.0 | 4.7 | 4,696 |
| 10-14 years | 80.3 | 12.2 | 1.7 | 5.8 | 100.0 | 10.0 | 4,522 |
| 15-17 years | 71.3 | 16.5 | 2.5 | 9.8 | 100.0 | 17.2 | 2,434 |
| Residence |  |  |  |  |  |  |  |
| Urban | 75.0 | 13.8 | 2.1 | 9.1 | 100.0 | 9.6 | 2,563 |
| Rural | 84.9 | 11.0 | 1.2 | 2.9 | 100.0 | 7.2 | 13,426 |
| Sex |  |  |  |  |  |  |  |
| Male | 84.0 | 11.5 | 1.4 | 3.1 | 100.0 | 7.3 | 8,075 |
| Female | 82.6 | 11.3 | 1.3 | 4.7 | 100.0 | 7.8 | 7,913 |
| Total age $<15$ years | 85.4 | 10.5 | 1.2 | 2.9 | 100.0 | 5.9 | 13,554 |
| Total age $<18$ years | 83.3 | 11.4 | 1.4 | 3.9 | 100.0 | 7.6 | 15,988 |

${ }^{1}$ Includes children with father dead, mother dead, both parents dead, and one parent dead but missing information on survival status of the other parent

Table 8 Birth registration of children under age five
Percentage of de jure children under age five years whose birth was registered with the civil authorities, according to background characteristics, Meghalaya, 2015-16

| Background characteristic | Percentage of children whose birth was registered |  |  | De jure children |
| :---: | :---: | :---: | :---: | :---: |
|  | Registered, has a birth certificate | Registered, does not have a birth certificate | Total registered |  |
| Age |  |  |  |  |
| < 2 years | 32.8 | 43.6 | 76.4 | 1,664 |
| 2-4 years | 55.8 | 26.1 | 82.0 | 2,671 |
| Sex |  |  |  |  |
| Male | 46.4 | 33.9 | 80.2 | 2,167 |
| Female | 47.6 | 31.8 | 79.4 | 2,169 |
| Residence |  |  |  |  |
| Urban | 64.3 | 24.9 | 89.2 | 583 |
| Rural | 44.3 | 34.0 | 78.4 | 3,753 |
| Total | 47.0 | 32.8 | 79.8 | 4,335 |

Table 9 Birth registration of children under age five by district
Percentage of de jure children under age five years whose birth was registered with the civil authorities, by district, Meghalaya, 2015-16

|  | Percentage of children whose <br> birth was registered |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Registered, <br> has a birth <br> certificate | Registered, <br> does not have a <br> birth certificate | Total <br> registered | De jure <br> children |
| District | 31.5 | 25.5 | 56.9 | 543 |

| Don't know | 0.2 | 0.1 | 23 | 30 | 1 | 1 |
| Total age 15-49 | 100.0 | 100.0 | 9,201 | 9,201 | 1,146 | 1,144 |
| Age 50-54 | na | 7.3 | na | na | 90 | 92 |
| Total age 15-54 | na | 100 | na | na | 1,236 | 1,236 |
| Employment status (past 12 months) |  |  |  |  |  |  |
| Employed at any time | 43.9 | 76.8 | 631 | 677 | 881 | 869 |
| In agricultural occupation | 18.9 | 32.2 | 271 | 289 | 369 | 365 |
| In non-agricultural occupation | 22.7 | 40.9 | 326 | 356 | 469 | 457 |
| Don't know | 2.3 | 3.8 | 34 | 32 | 43 | 47 |
| Not employed | 56.1 | 23.2 | 805 | 784 | 266 | 275 |
| Total age 15-49 | 100.0 | 100.0 | 1,436 | 1,461 | 1,146 | 1,144 |
| Age 50-54 | na | 7.3 | na | na | 90 | 92 |
| Total age 15-54 | na | 100 | na | na | 1,236 | 1,236 |

na $=$ Not applicable
${ }^{1}$ Refers to women/men who can read a whole sentence or part of a sentence and women/men who completed standard 6 or higher (who are assumed to be literate)

Table 11 Current fertility
Age-specific and total fertility rates and crude birth rates from NFHS-4 and NFHS-3 by residence, and total for NFHS-2 and NFHS-1, Meghalaya

| Age | NFHS-4 |  |  | NFHS-3 |  |  | $\frac{\text { NFHS-2 }}{\text { Total }}$ | NFHS-1 <br> Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Urban | Rural | Total | Urban | Rural | Total |  |  |
| 15-19 | 0.016 | 0.058 | 0.048 | 0.032 | 0.062 | 0.054 | 0.086 | 0.079 |
| 20-24 | 0.085 | 0.172 | 0.152 | 0.116 | 0.219 | 0.190 | 0.211 | 0.182 |
| 25-29 | 0.110 | 0.182 | 0.165 | 0.150 | 0.215 | 0.197 | 0.232 | 0.180 |
| 30-34 | 0.073 | 0.138 | 0.123 | 0.061 | 0.166 | 0.136 | 0.184 | 0.117 |
| 35-39 | 0.043 | 0.095 | 0.083 | 0.049 | 0.118 | 0.100 | 0.105 | 0.115 |
| 40-44 | 0.003 | 0.040 | 0.030 | (0.023) | 0.067 | 0.055 | 0.080 | 0.051 |
| 45-49 | 0.004 | 0.009 | 0.008 | * | (0.028) | 0.027 | (0.014) | 0.022 |
| TFR (15-49) | 1.67 | 3.47 | 3.04 | 2.28 | 4.38 | 3.80 | 4.57 | 3.73 |
| CBR | 16.1 | 26.7 | 24.6 | 21.1 | 31.0 | 28.7 | 35.7 | 31.9 |

Note: Rates are for the period 1-36 months preceding the survey (approximately 1990-92 for NFHS-1, 1996-98 for NFHS-2, 2003-05 for NFHS-3, and 2013-15 for NFHS-4). Age-specific fertility rates are expressed per woman. Rates for the age group 45-49 might be slightly biased due to truncation.
TFR $=$ Total fertility rate, expressed per woman
CBR $=$ Crude birth rate, expressed per 1,000 population
( ) Based on 125-249 unweighted woman-years of exposure

* Rate not shown; based on fewer than 125 unweighted woman-years of exposure

Table 12 Fertility by background characteristics
Total fertility rate for the three years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility rate, by background characteristics, Meghalaya, 2015-16

| Background characteristic | Total fertility rate | Percentage of women age 15-49 currently pregnant | Mean number of children ever born to women age 40-49 | Total wanted fertility rate |
| :---: | :---: | :---: | :---: | :---: |

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status. All modern methods includes users of male sterilization, who are not shown separately.
IUD $=$ Intrauterine device; PPIUD $=$ Postpartum intrauterine device
AYUSH = Ayurveda, yoga and naturopathy, unani, siddha and homeopathy; UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare centre; CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist; NGO = Nongovernmental organization
${ }^{1}$ Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods
( ) Based on 25-49 unweighted cases

* Percentage not shown; based on fewer than 25 unweighted cases

Table 26 Informed choice
Among women who are current users of selected modern contraceptive methods who started the last episode of use within the five years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, and the percentage who were ever told by a health or family planning worker about other methods of family planning they could use, by method, according to residence, Meghalaya, 2015-16

| Method | Percentage who were informed about possible side effects or problems of method used | Percentage who were informed about what to do if they experienced side effects | Percentage who were ever told by a health or family planning worker of other methods that could be used | Number of women |
| :---: | :---: | :---: | :---: | :---: |
| URBAN |  |  |  |  |
| Female sterilization ${ }^{1}$ | (59.7) | (50.1) | (68.1) | 31 |
| Pill | 63.9 | 45.9 | 82.9 | 61 |
| IUD or PPIUD | * | * | * | 25 |
| Total | 63.2 | 48.6 | 73.7 | 117 |
| RURAL |  |  |  |  |
| Female sterilization ${ }^{1}$ | 76.6 | 72.1 | 78.5 | 73 |
| Pill | 54.5 | 43.0 | 68.8 | 404 |
| IUD or PPIUD | 76.1 | 73.8 | 84.3 | 56 |
| Total | 59.8 | 50.2 | 71.8 | 533 |
| TOTAL |  |  |  |  |
| Female sterilization ${ }^{1}$ | 71.6 | 65.5 | 75.4 | 104 |
| Pill | 55.7 | 43.4 | 70.6 | 465 |
| IUD or PPIUD | 73.0 | 67.4 | 76.3 | 81 |
| Total | 60.4 | 49.9 | 72.1 | 650 |

Note: Table includes only the contraceptive methods separately shown in the table and excludes users who obtained their method from friends/relatives or husband.
IUD $=$ Intrauterine device; PPIUD $=$ Postpartum intrauterine device
${ }^{1}$ Among women who were sterilized in the five years preceding the survey
() Based on 25-49 unweighted cases

* Percentage not shown; based on fewer than 25 unweighted cases

Table 27 Twelve-month contraceptive discontinuation rates
Among women age 15-49 who started an episode of contraceptive use within the five years preceding the survey, the percentage of episodes discontinued within 12 months, by reason for discontinuation and specific method, Meghalaya, 2015-16

| Method | Reason for discontinuation |  |  |  |  |  |  |  | Switched to another method ${ }^{4}$ | Number of episodes of use ${ }^{5}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Method failure | Desire to become pregnant | Other fertility related reason | Side effects/health concerns | Wanted more effective method | Other method related reason ${ }^{2}$ | Other reason | $\begin{gathered} \text { Any } \\ \text { reason³ } \end{gathered}$ |  |  |
| Pill | 0.0 | 7.7 | 3.2 | 9.2 | 1.5 | 3.7 | 1.8 | 27.2 | 3.3 | 768 |
| Condom/Nirodh | (0.6) | (6.8) | (9.6) | (3.7) | (0.0) | (20.2) | (19.9) | (60.7) | (21.6) | 157 |
| Other ${ }^{6}$ | (2.1) | (12.7) | (2.0) | (2.5) | (1.2) | (24.3) | (13.5) | (58.2) | (21.5) | 314 |
| All modern spacing methods ${ }^{7}$ | 0.1 | 7.3 | 4.2 | 7.6 | 1.2 | 8.9 | 5.6 | 35.0 | 7.8 | 1,149 |
| All spacing methods ${ }^{8}$ | 0.9 | 8.8 | 3.8 | 6.0 | 1.1 | 11.6 | 6.7 | 39.0 | 10.4 | 1,443 |
| All methods | 0.8 | 8.2 | 3.6 | 5.6 | 1.1 | 10.8 | 6.2 | 36.3 | 9.6 | 1,555 |

Note: Figures are based on life table calculations using information on episodes of contraceptive use that began 3-62 months preceding the survey. All methods includes female sterilization, male sterilization, IUD or PPIUD, and rhythm, which are not shown separately.
IUD = Intrauterine device; PPIUD = Postpartum intrauterine device
${ }^{1}$ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation
${ }^{2}$ Includes lack of access/too far, costs too much, and inconvenient to use
${ }^{3}$ Reasons for discontinuation are mutually exclusive and add to the total in this column
${ }^{4}$ The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within two months of discontinuation.
${ }^{5}$ Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation
${ }^{6}$ Includes injectables, female condom, diaphragm, foam/jelly, standard days method, LAM, withdrawal, and other modern and traditional methods that are not shown separately
${ }^{7}$ Includes other modern spacing methods that are not shown separately
${ }^{8}$ Includes other spacing methods that are not shown separately
() Based on 25-49 unweighted cases

Table 28 Men's contraception-related perceptions and knowledge
Percentage of men age 15-49 who agree with two specific statements about women and contraception, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Meghalaya, 2015-16

| Background characteristic | Percentage of men who agree |  | Percentage of men who say that if a male condom is used correctly, it protects against pregnancy: |  |  |  |  | Number of men |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Contraception is women's business and a man should not have to worry about it | Women who use contraception may become promiscuous |  |  |  |  |  |  |
|  |  |  | Most of the time | Sometimes | Not at all | Don't know/unsure ${ }^{1}$ | Total |  |
| Age |  |  |  |  |  |  |  |  |

|  | For spacing | For limiting | Total | $\begin{gathered} \text { For } \\ \text { spacing } \end{gathered}$ | For limiting | Total | For spacing | For limiting | Total |  |  |  |
| Caste/tribe |  |  |  |  |  |  |  |  |  |  |  |  |
| Scheduled caste | 6.4 | 13.7 | 20.2 | 9.8 | 21.6 | 31.4 | 16.2 | 35.3 | 51.5 | 60.9 | 50.4 | 186 |
| Scheduled tribe | 16.4 | 5.4 | 21.8 | 9.0 | 13.0 | 22.0 | 25.4 | 18.4 | 43.7 | 50.2 | 45.8 | 4,828 |
| Other backward class | (7.6) | (12.4) | (20.0) | (10.7) | (19.8) | (30.4) | (18.3) | (32.1) | (50.4) | (60.4) | (60.4) | 38 |
| Other | 8.0 | 8.5 | 16.4 | 15.3 | 28.3 | 43.6 | 23.3 | 36.8 | 60.0 | 72.6 | 62.7 | 488 |
| Total | 15.2 | 6.0 | 21.2 | 9.5 | 14.8 | 24.3 | 24.8 | 20.7 | 45.5 | 53.4 | 48.2 | 5,553 |

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting. Total includes women who don't know their caste/tribe, who are not shown ${ }^{1}$ Total demand is the sum of unmet need and met need
${ }_{3}^{2}$ Percentage of demand satisfied is met need divided by total demand method (LAM), and other modern methods ( ) Based on 25-49 unweighted cases

Table 30 Unmet need for family planning by district
Percentage of currently married women age 15-49 with unmet need for family planning by district, Meghalaya, 2015-16, and total for NFHS-3

| District | Total <br> unmet need | Unmet need <br> for spacing | Unmet need <br> for limiting | Number <br> of women |
| :--- | :---: | :---: | :---: | :---: |
| East Garo Hills | 25.7 | 12.9 | 12.8 | 785 |
| East Khasi Hills | 23.3 | 17.1 | 6.3 | 1,436 |
| Jaintia Hills | 22.6 | 18.1 | 4.4 | 631 |
| Ribhoi | 23.9 | 18.2 | 5.7 | 434 |
| South Garo Hills | 16.2 | 11.7 | 4.5 | 300 |
| West Garo Hills | 14.2 | 10.4 | 3.7 | 1,337 |
| West Khasi Hills | 24.7 | 20.9 | 3.8 | 630 |
| Meghalaya | 21.2 | 15.2 | 6.0 | 5,553 |
| NFHS-3 (2005-06) | 35.7 | 23.2 | 12.5 | 1,212 |

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.

Table 31 Pregnancy outcome
Percent distribution of last pregnancies among women age 15-49 during the five years preceding the survey by pregnancy outcome, according to background characteristics, Meghalaya, 2015-16

| Background characteristic | Pregnancy outcome |  |  |  | Total | Number of pregnancies |

[^7]Table 40 Antenatal care indicators by district
Among women with a live birth in the five years preceding the survey, percentage who received different types of antenatal care (ANC) during the pregnancy for their most recent live birth, and among women with registered pregnancies, percentage who received a Mother and Child Protection Card (MCP Card), by district, Meghalaya, 2015-16

| District | Percentage who had four or more ANC visits | Percentage with an ANC visit in the first trimester of pregnancy | Percentage who took IFA for at least 100 days | Percentage who received two or more TT injections during the pregnancy | Percentage who had full antenatal care ${ }^{1}$ | Number of women | Percentage of women who received an MCP Card | Number of registered pregnancies |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| East Garo Hills | 29.6 | 32.6 | 19.6 | 52.7 | 8.6 | 410 | 97.6 | 245 |
| East Khasi Hills | 72.8 | 72.5 | 56.4 | 68.8 | 41.5 | 829 | 88.5 | 731 |
| Jaintia Hills | 52.7 | 63.3 | 43.2 | 72.6 | 31.2 | 470 | 90.4 | 402 |
| Ribhoi | 40.6 | 43.9 | 33.5 | 61.8 | 18.6 | 282 | 97.2 | 236 |

## Table 44 Delivery and postnatal care-Continued

Percent distribution of live births in the five years preceding the survey by place of delivery and assistance during delivery, percentage delivered by a skilled provider and by caesarean section, percentage of live births delivered at home that were delivered by a skilled provider and percentage for which the delivery protocol was followed, and percent distribution of women giving birth in the five years preceding the survey by timing and type of provider of the first postnatal check of the mother for their most recent live birth, by residence, Meghalaya, 2015-16

| Delivery and postnatal care descriptors | Urban | Rural | Total |
| :--- | ---: | ---: | ---: |
| Type of provider of mother's first postnatal check ${ }^{6}$ |  |  |  |
| Doctor |  |  |  |
| ANM/nurse/midwife/LHV | 69.8 | 33.9 | 39.1 |
| Other health personnel | 0.0 | 17.4 | 16.9 |
| Dai (TBA) | 1.3 | 0.2 | 0.2 |
| Other | 1.7 | 4.4 | 3.9 |
| No postnatal check | 13.7 | 9.9 | 8.7 |
| Total | 100.0 | 100.0 | 31.3 |
| Number of last live births |  |  | 100.0 |

NGO = Nongovernmental organization; ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant
${ }^{1}$ Includes missing
${ }^{2}$ If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table
${ }^{3}$ Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel
${ }^{4}$ A caesarean section for which the decision to have the operation was made after the onset of labour
${ }^{5}$ Based on the last live birth in the five years preceding the survey
${ }^{6}$ Based on the last live birth in the five years preceding the survey. Postnatal checks are checks on the woman's health within 42 days of the birth

Table 45 Delivery and postnatal care by background characteristics
Percentage of live births in the five years preceding the survey delivered in a health facility and percentage delivered with assistance from health personnel, and percentage of women who had a live birth in the five years preceding the survey who received a postnatal check and who received a postnatal check within two days of birth for their most recent birth, by background characteristics, Meghalaya, 2015-16

| Background characteristic | Percentage of births delivered in a public health facility | Percentage of births delivered in a private health facility | Percentage of births delivered in a health facility | Percentage of deliveries assisted by health personnel ${ }^{1}$ | Number of births | Percentage of women with a postnatal check ${ }^{2,3}$ | Percentage of women with a postnatal check within two days of birth ${ }^{2,3}$ | Number of women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Mother's age at birth |  |  |  |  |  |  |  |  |

| Total | 39.4 | 11.9 | 51.3 | 53.8 | 4,349 | 68.7 | 55.8 | 3,077 |

Note: Total includes births belonging to an other backward class, births whose caste/tribe is not known, and births delivered in an "other" place of delivery, which are not shown separately.
na $=$ Not applicable
${ }^{1}$ Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.
${ }^{2}$ Based on the last live birth in the five years preceding the survey
${ }^{3}$ Postnatal checks are checks on the woman's health within 42 days of the birth
${ }^{4}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
${ }^{5}$ Includes nongovernmental organizations or trust hospitals/clinics
( ) Based on 25-49 unweighted cases

Table 46 Delivery and postnatal care by district
Percentage of live births in the five years preceding the survey delivered in a health facility, percentage delivered with assistance from health personnel and percentage delivered by caesarean section, and percentage of women who had a live birth in the five years preceding the survey who received a postnatal check within two days of birth for their most recent birth, by district, Meghalaya, 2015-16

| District | Percentage of births delivered in a public health facility | Percentage of births delivered in a private health facility | Percentage of births delivered in a health facility | Percentage of deliveries assisted by health personnel ${ }^{1}$ | Percentage of births delivered by caesarean section | Number of births | Percentage of women with a postnatal check within two days of birth ${ }^{2}$ | Number of women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| East Garo Hills | 42.4 | 1.8 | 44.2 | 50.3 | 4.9 | 546 | 30.5 | 410 |
| East Khasi Hills | 41.2 | 25.5 | 66.7 | 69.5 | 14.3 | 1,198 | 71.7 | 829 |
| Jaintia Hills | 32.4 | 11.9 | 44.3 | 46.0 | 4.6 | 721 | 57.3 | 470 |
| Ribhoi | 38.3 | 6.6 | 44.9 | 46.5 | 5.8 | 416 | 56.0 | 282 |
| South Garo Hills | 82.3 | 6.1 | 88.4 | 89.0 | 8.1 | 142 | 85.1 | 118 |
| West Garo Hills | 40.8 | 4.7 | 45.5 | 46.8 | 6.2 | 689 | 39.7 | 550 |
| West Khasi Hills | 31.2 | 7.8 | 38.9 | 40.8 | 3.4 | 636 | 59.7 | 419 |
| Meghalaya | 39.4 | 11.9 | 51.3 | 53.8 | 7.6 | 4,349 | 55.8 | 3,077 |

${ }^{1}$ Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.
${ }^{2}$ Postnatal checks are checks on the woman's health within 42 days of the birth

Table 47 Delivery costs and financial assistance
The average out-of-pocket cost paid for delivery for the most recent live birth among women who had a live birth in the five years preceding the survey that was delivered in a health facility by type of facility, and among women who had a live birth in the five years preceding the survey for the most recent birth that was delivered in a health facility, the percentage who received financial assistance under Janani Suraksha Yojana (JSY), according to background characteristics, Meghalaya, 2015-16

| Background characteristic | Average cost (Rs.) ${ }^{1}$ |  |  | Percentage who received financial assistance under JSY | Number of births in a health facility |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Public health facility | Private health facility | Any health facility |  |  |
| Mother's age at birth |  |  |  |  |  |
| <20 | 2,503 | 18,203 | 5,699 | 39.4 | 192 |
| 20-34 | 3,492 | 18,741 | 7,361 | 27.9 | 1,308 |
| 35-49 | 3,032 | 21,450 | 7,558 | 17.1 | 186 |
| Birth order |  |  |  |  |  |

| 12 or more years complete | 4,363 | 21,718 | 12,841 | 19.8 | 345 |
| Religion |  |  |  |  |  |
| Hindu | 4,170 | 22,836 | 9,111 | 22.7 | 160 |
| Muslim | $(2,487)$ | $(35,302)$ | $(6,471)$ | (50.9) | 58 |
| Christian | 3,390 | 17,723 | 6,938 | 27.0 | 1,345 |
| Other | 1,938 | 22,525 | 7,740 | 35.8 | 123 |
| Caste/tribe |  |  |  |  |  |
| Scheduled caste | $(5,779)$ | $(25,488)$ | $(11,823)$ | (9.4) | 49 |
| Scheduled tribe | 3,347 | 18,242 | 7,041 | 27.8 | 1,544 |
| Other ${ }^{2}$ | 1,869 | 29,073 | 7,378 | 45.2 | 85 |
| Total | 3,324 | 18,987 | 7,195 | 28.0 | 1,686 |

Note: Total includes information on births belonging to an other backward class and births whose caste/tribe is not known, which is not shown separately.
${ }^{1}$ Excludes women who don't know the cost
${ }^{2}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
() Based on 25-49 unweighted cases

## Table 48 Birth order and delivery characteristics by district

Percentage of births during the three years preceding the survey of birth order 3 or more, percentage of women who had a live birth in the five years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth and among women who had a live birth in the five years preceding the survey for the most recent birth that was delivered in a health facility, the percentage of women who received financial assistance under Janani Suraksha Yojana (JSY) by district, Meghalaya, 2015-16

| District | Percentage of births of birth order 3 or more | Number of births | Percentage of last births receiving antenatal care from doctor | Percentage of last births receiving antenatal care from ANM/nurse/ midwife/LHV | Number of last births | Percentage of births in a health facility receiving financial assistance under JSY | Number of births in a health facility |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| East Garo Hills | 45.3 | 297 | 34.0 | 36.8 | 410 | 18.6 | 197 |
| East Khasi Hills | 51.3 | 728 | 76.4 | 33.4 | 829 | 26.1 | 583 |
| Jaintia Hills | 58.3 | 427 | 72.3 | 48.7 | 470 | 29.2 | 226 |
| Ribhoi | 53.2 | 249 | 61.7 | 52.6 | 282 | 44.7 | 136 |
| South Garo Hills | 34.4 | 75 | 84.9 | 72.8 | 118 | 2.6 | 105 |
| West Garo Hills | 40.9 | 363 | 58.1 | 66.4 | 550 | 28.0 | 265 |
| West Khasi Hills | 53.4 | 384 | 50.8 | 61.4 | 419 | 45.8 | 174 |
| Meghalaya | 50.3 | 2,523 | 62.4 | 49.2 | 3,077 | 28.0 | 1,686 |

ANM = Auxiliary nurse midwife; LHV = Lady health visitor

Table 49 Timing of first health check after birth for the newborn
Percent distribution of last births in the five years preceding the survey by time after birth of first health check, and the percentage of births with a health check in the first two days after birth, according to background characteristics, Meghalaya, 2015-16

| $\underline{\text { Background characteristic }}$ | Time after birth of newborn's first health check |  |  |  |  |  | No health check ${ }^{1}$ | Total | Percentage of births with a health check in the first two days after birth | Number of births |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Less than 1 hour | $\begin{gathered} 1-3 \\ \text { hours } \\ \hline \end{gathered}$ | $\begin{gathered} 4-23 \\ \text { hours } \\ \hline \end{gathered}$ | $\begin{gathered} 1-2 \\ \text { days } \end{gathered}$ | $\begin{array}{r} 3-6 \\ \text { days } \\ \hline \end{array}$ | Don't know |  |  |  |  |
| Mother's age at birth |  |  |  |  |  |  |  |  |  |  |
| $<20$ | 5.0 | 4.9 | 0.0 | 7.7 | 4.7 | 1.0 | 76.7 | 100.0 | 17.6 | 377 |
| 20-34 | 3.6 | 6.4 | 0.7 | 6.3 | 4.6 | 0.9 | 77.5 | 100.0 | 17.0 | 2,308 |

Note: Total includes births delivered in an "other" place of delivery, births belonging to an other backward class, and births whose caste/tribe is not known, which are not shown separately.
${ }^{1}$ Includes newborns who received a health check after the first week
${ }^{2}$ Includes nongovernmental organizations or trust hospitals/dinics
${ }^{3}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class.
( ) Based on 25-49 unweighted cases

Table 50 Trends in maternal care indicators
Maternal care indicators for births during the three years preceding the survey by residence, NFHS-4 and NFHS-3, Meghalaya

| Indicator | NFHS-4 <br> $(2015-16)$ | NFHS-3 <br> $(2005-06)$ |
| :--- | :---: | :---: |
|  |  |  |
| Percentage who received antenatal care ${ }^{1}$ |  |  |
| Percentage who had at least four antenalal care visits $^{1}$ | 69.7 | 92.9 |
| Percentage who received antenatal care within the first trimester of pregnancy $^{1}$ | 67.3 | 68.5 |
| Percentage who received full antenatal care $^{1,2}$ | 38.5 | 10.7 |
| Percentage of births delivered in a health facility $^{3}$ | 90.6 | 75.0 |
| Percentage of deliveries assisted by health personnel $^{3,4}$ | 93.1 | 78.1 |

| RURAL |  |  |
| :---: | :---: | :---: |
| Percentage who received antenatal care ${ }^{1}$ | 80.5 | 62.7 |
| Percentage who had at least four antenatal care visits ${ }^{1}$ | 47.7 | 37.3 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 52.0 | 26.9 |
| Percentage who received full antenatal care ${ }^{1,2}$ | 21.7 | 3.3 |
| Percentage of births delivered in a health facility ${ }^{3}$ | 47.9 | 20.4 |
| Percentage of deliveries assisted by health personnel ${ }^{3,4}$ | 50.3 | 22.1 |
| TOTAL |  |  |
| Percentage who received antenatal care ${ }^{1}$ | 82.1 | 67.8 |
| Percentage who had at least four antenatal care visits ${ }^{1}$ | 50.6 | 42.6 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 54.1 | 32.6 |
| Percentage who received full antenatal care ${ }^{1,2}$ | 23.9 | 4.5 |
| Percentage of births delivered in a health facility ${ }^{3}$ | 53.6 | 29.6 |
| Percentage of deliveries assisted by health personnel ${ }^{3,4}$ | 56.0 | 31.6 |

${ }^{1}$ Based on the last birth to women in the three years preceding the survey
${ }^{2}$ Full antenatal care includes having received at least four antenatal care visits, having received at least one tetanus toxoid (TT) injection, and having taken iron and folic acid (IFA) tablets or syrup for 100 or more days
${ }^{3}$ Based on all births in the three years preceding the survey
${ }^{4}$ Doctor, auxiliary nurse midwife (ANM), nurse, midwife, lady health visitor (LHV), or other health personnel

Table 51 Male involvement in maternal care: Men's report
Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present for at least one antenatal check-up, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Meghalaya, 2015-16

| Antenatal and delivery care information | Urban | Rural | Total |
| :---: | :---: | :---: | :---: |
| Percentage of men for whom the youngest child's mother received antenatal care | 92.6 | 85.8 | 86.8 |
| Percentage of men who were present at any antenatal check-up | 56.6 | 40.4 | 43.0 |
| Percentage who were told by a health provider or worker about the following signs of pregnancy complications: |  |  |  |
| Vaginal bleeding | 42.1 | 26.9 | 29.2 |
| Convulsions | 39.0 | 20.6 | 23.5 |
| Prolonged labour | 48.1 | 31.6 | 34.2 |
| Severe abdominal pain | 55.4 | 36.4 | 39.4 |
| High blood pressure | 39.4 | 34.8 | 35.5 |
| Percentage ever told what to do if the mother had any pregnancy complications | 35.3 | 32.7 | 33.1 |
| Percentage whose youngest child age 0-35 months was delivered in a health facility | 85.7 | 49.8 | 55.4 |
| Percentage to whom a health provider or worker spoke about the following aspects of maternal care: |  |  |  |
| The importance of delivering in a health facility | 62.1 | 63.7 | 63.4 |
| The importance of proper nutrition for the mother during pregnancy | 59.6 | 68.0 | 66.7 |
| Family planning or delaying his next child | 48.9 | 40.5 | 41.8 |
| Number of men with a youngest child age 0-35 months | 48 | 258 | 306 |
| Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of: |  |  |  |
| Cord care | * | 38.0 | 36.9 |
| Breastfeeding the baby immediately after delivery | * | 58.4 | 57.0 |
| Keeping the baby warm immediately after birth | * | 53.8 | 52.6 |
| Number of men whose youngest child age 0-35 months was not delivered in a health facility | 7 | 130 | 136 |

* Percentage not shown; based on fewer than 25 unweighted cases
Table 52 Vaccinations by background characteristics
Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report) and percentage with a vaccination card seen by the interviewer, by background characteristics, Meghalaya, 2015-16, and total for NFHS-3

| Background characteristic | Hepatitis $\mathrm{B}^{1}$ |  |  |  | BCG | DPT |  |  | Polio ${ }^{1}$ |  |  |  | Measles | All basic vaccinations ${ }^{2}$ | No vaccinations | Percentage with a vaccination card seen | Number <br> of children |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 1 | 2 | 3 |  | 1 | 2 | 3 | 0 | 1 | 2 | 3 |  |  |  |  |  |

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards adopted in 2006. The indices in this table are NOT comparable to those based on the previously used 1977 NCHS/CDC/WHO Reference. Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Total includes children belonging to an other backward class and children whose caste/tribe is not known, who are not shown ${ }^{\text {separately. }} 1$ Recumbent
${ }^{1}$ Recumbent length is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm ; standing height is measured for all other children
${ }^{2}$ Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median
${ }^{3}$ Excludes children whose mothers were not interviewed
${ }^{4}$ First born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval
${ }^{5}$ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule
${ }^{6}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
${ }^{7}$ Includes children whose mothers are deceased
${ }^{7}$ Includes children whose mothers are deceased
${ }^{8}$ Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months.
Mother's nutritional status in terms of BMI (body mass index) is presented in Table 70 . ( ) Based on 25-49 unweighted cases

Table 61 Initial breastfeeding
Among last-born children who were born in the two years preceding the survey, the percentage who were ever breastfed, and the percentage who started breastfeeding within one hour and one day of birth, and among last-born children born in the two years preceding the survey who were ever breastfed, the percentage who received a prelacteal feed, by background characteristics, Meghalaya, 2015-16

|  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |

Note: Table is based on last-born children born in the past two years whether the children are living or dead at the time of interview. Total includes children belonging to a scheduled caste or other backward class, children whose caste/tribe is not known, and children who were delivered in an "other" place of delivery, who are not shown separately.
TBA $=$ Traditional birth attendant
${ }^{1}$ Includes children who started breastfeeding immediately after birth
${ }^{2}$ Includes children who started breastfeeding within one hour of birth
${ }^{3}$ Children given something other than breastmilk during the first three days of life
${ }^{4}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
${ }^{5}$ Doctor, nurse, midwife, auxiliary nurse midwife, lady health visitor, or other health personnel
Table 62 Breastfeeding status by age
Percent distribution of youngest children under two years living with the mother by breastfeeding status, percentage currently breastfeeding, and percentage of all children under two years using a bottle with a nipple, according to age in months, Meghalaya, 2015-16

| Age in months | Not breastfeeding | Exclusively breastfed | Breastfeeding and consuming: |  |  |  | Total | Percentage currently breastfeeding | Number of youngest children under two years living with the mother | Percentage using a bottle with a nipple | Number of all children under two years |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| <6 | 2.5 | 35.8 | 28.4 | 2.0 | 10.2 | 21.1 | 100.0 | 97.5 | 350 | 24.8 | 352 |
| 6-9 | 4.0 | 4.5 | 14.6 | 1.3 | 4.0 | 71.6 | 100.0 | 96.0 | 289 | 29.9 | 289 |
| 12-15 | 11.9 | 2.0 | 4.0 | 0.4 | 0.2 | 81.5 | 100.0 | 88.1 | 324 | 26.6 | 329 |
| 12-23 | 21.7 | 1.3 | 1.9 | 0.2 | 0.1 | 74.8 | 100.0 | 78.3 | 810 | 30.9 | 843 |
| 20-23 | 33.5 | 0.5 | 0.3 | 0.0 | 0.0 | 65.7 | 100.0 | 66.5 | 219 | 31.0 | 236 |

Note: Breastfeeding status refers to a " 24 -hour" period (yesterday and last night). Children who are classified as breastfeeding and consuming plain water only consumed no
liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water, non-milk liquids/juice, other milk, and liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus children who receive breastmilk and nonwater. Any children who get complementary food are classified in that category as long as they are breastfeeding as well.
Table 63 Median duration of breastfeeding and infant and young child feeding (IYCF) practices

| Median duration (months) of breastfeeding among last-born children born in the ast three years ${ }^{1}$ | Among breastfed children 6-23 months, percentage fed: | Among nonbreastfed children 6-23 months, percentage fed: | Among all children 6-23 months, percentage fed: |

[^13]Table 72 Nutritional status and anaemia among children and women by district
Percentage of children age 6-59 months classified as having anaemia and percentage of women age 15-49 with anaemia and specific body mass index (BMI) levels by district, Meghalaya, 2015-16

| District | Percentage of children having any anaemia ( $<11.0 \mathrm{~g} / \mathrm{dl}$ ) | Number <br> of <br> children | Percentage of women having any anaemia $(<12.0 \mathrm{~g} / \mathrm{dl})^{1}$ | Number of women | Women with BMI < 18.5 (total thin) | Women with BMI $\geq 25.0$ (overweight or obese) | Number of women ${ }^{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| East Garo Hills | 75.4 | 458 | 65.8 | 1,102 | 11.2 | 8.7 | 1,042 |
| East Khasi Hills | 31.9 | 845 | 37.0 | 2,589 | 12.8 | 16.7 | 2,524 |
| Jaintia Hills | 27.5 | 649 | 39.5 | 1,026 | 13.2 | 10.4 | 936 |
| Ribhoi | 43.8 | 268 | 67.8 | 680 | 16.7 | 10.5 | 650 |
| South Garo Hills | 74.9 | 126 | 46.6 | 485 | 3.4 | 14.2 | 417 |
| West Garo Hills | 52.7 | 619 | 71.1 | 2,040 | 12.4 | 10.8 | 1,874 |
| West Khasi Hills | 19.6 | 583 | 37.1 | 973 | 10.1 | 8.2 | 874 |
| Meghalaya | 40.7 | 3,548 | 51.6 | 8,896 | 12.1 | 12.1 | 8,316 |

Note: Table is based on children/women who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude (and smoking status for women) using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). The body mass index (BMI) is expressed as the ratio of weight in kilograms to the square of height in meters $\left(\mathrm{kg} / \mathrm{m}^{2}\right)$.
${ }^{1}$ For pregnant women, the value is $<11.0 \mathrm{~g} / \mathrm{dl}$
${ }^{2}$ Excludes pregnant women and women with a birth in the preceding 2 months
Table 73 Knowledge and prevention of HIV/AIDS
Percentage of women and men age 15-49 who have heard of HIV or AIDS and who, in response to prompted questions, say that people can reduce the risk of getting HIV/AIDS by using a condom every time they have sexual intercourse, who know that the risk of HIV/AIDS can be reduced by limiting sex to one uninfected partner, who have a comprehensive knowledge about HIV/AIDS, and who know that HIV/AIDS can be transmitted from a mother to a baby, by background characteristics, Meghalaya, 2015-16

| Background characteristic | Percentage who have heard of HIV or AIDS |  | Percentage who know that people can reduce their chances of getting HIV/AIDS by using a condom every time they have sex |  | Percentage who know that the risk of HIV/AIDS can be reduced by limiting sex to one uninfected partner ${ }^{1}$ |  | Percentage who have a comprehensive knowledge about HIV/AIDS ${ }^{2}$ |  | Percentage who know that HIV/ AIDS can be transmitted from a mother to her baby |  | Number |  |

${ }^{1} \mathrm{~A}$ woman is classified as having hypertension if she has $\mathrm{SBP} \geq 140 \mathrm{mmHg}$ or DBP $\geq 90 \mathrm{mmHg}$ at the time of the survey, or she is currently taking antihypertension medication to control her blood pressure. The erm hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

## Table 93 Gender role attitudes

Percentage of women and men age 15-49 with specific attitudes toward wife beating and refusal by a wife to have sex with her husband by reason, and percentage of men age 15-49 who agree that a man can behave in specific ways if his wife refuses to have sex with him, according to marital status, Meghalaya, 2015-16

| Reason/behaviour | Ever-married |  | Never married |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Women | Men | Women | Men | Women | Men |

| Percentage who agree that a husband is justified in hitting or beating his wife if: |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| She goes out without telling him | 14.6 | 20.0 | 8.8 | 14.8 | 12.8 | 17.8 |
| She neglects the house or children | 26.1 | 36.0 | 15.0 | 27.2 | 22.5 | 32.3 |
| She argues with him | 23.0 | 18.6 | 14.7 | 18.7 | 20.4 | 18.6 |
| She refuses to have sexual intercourse with him | 8.6 | 4.9 | 5.9 | 7.0 | 7.7 | 5.8 |
| She doesn't cook properly | 10.7 | 15.6 | 6.7 | 8.2 | 9.4 | 12.5 |
| He suspects her of being unfaithful | 23.0 | 25.8 | 16.0 | 17.5 | 20.8 | 22.2 |
| She shows disrespect for in-laws | 20.6 | 32.3 | 13.5 | 24.7 | 18.3 | 29.1 |
| Percentage who agree with at least one specified reason | 41.3 | 48.0 | 26.3 | 38.7 | 36.6 | 44.0 |
| Percentage who agree that a wife is justified in refusing to have sex with her husband when she: |  |  |  |  |  |  |
| Knows her husband has a sexually transmitted disease | 64.8 | 77.0 | 55.3 | 67.4 | 61.8 | 72.9 |
| Knows her husband has sex with other women | 64.2 | 76.2 | 54.5 | 68.2 | 61.1 | 72.8 |
| Is tired or not in the mood | 60.8 | 67.2 | 52.1 | 58.8 | 58.0 | 63.6 |
| Percentage who agree with all three reasons | 52.6 | 55.7 | 45.0 | 47.3 | 50.2 | 52.1 |
| Percentage who agree with none of the three reasons | 29.6 | 13.3 | 40.6 | 21.4 | 33.1 | 16.8 |
| Percentage who agree that when a wife refuses to have sex with her husband, he has the right to: |  |  |  |  |  |  |
| Get angry and reprimand her | na | 13.9 | na | 16.0 | na | 14.8 |
| Refuse to give her financial support | na | 7.2 | na | 7.8 | na | 7.5 |
| Use force to have sex even if she doesn't want to | na | 6.1 | na | 4.8 | na | 5.6 |
| Have sex with another woman | na | 14.2 | na | 8.7 | na | 11.9 |
| Percentage who agree with all four behaviours | na | 1.1 | na | 2.2 | na | 1.6 |
| Percentage who agree with none of the four behaviours | na | 72.0 | na | 77.5 | na | 74.4 |
| Number of respondents | 981 | 656 | 455 | 490 | 1,436 | 1,146 |

[^20]Percentage of women and men age 15-49 who agree that a husband is justified in hitting or beating his wife for at least one specified reason, who agree that a wife is justified in refusing to have sex with her husband for all specified reasons, and percentage of men who agree that when a wife refuses to have sex with her husband, the husband does not have the right to any of the four specified behaviours, by background characteristics, Meghalaya, 2015-16

| Total | 11.0 | 27.3 | 4.9 | 28.7 | 31.6 | 646 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women whose husbands drink alcohol, but never get drunk; women whose husbands displayed 5-6 marital control behaviours; and women whose husbands agreed with 7 reasons for justification of wife beating, who are not shown separately.
${ }^{1}$ Currently married women only
${ }^{2}$ Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money
${ }^{3}$ Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives
${ }^{4}$ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws
${ }^{5}$ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood
( ) Based on 25-49 unweighted cases

Table 100 Injuries to women due to spousal violence
Percentage of ever-married women age 15-49 who have experienced spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Meghalaya, 2015-16

Table 101 Help seeking
Percentage of women age 15-49 who have ever experienced physical or sexual violence by whether they have ever sought help, and among those who have sought help from any source, the source from which help was sought, according to the type of violence experienced and marital status, Meghalaya, 2015-16

## APPENDIX

## ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) nonsampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fourth National Family Health Survey (NFHS-4) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-4 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-4 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-4 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, $r=y / x$, where $y$ represents the total sample value for variable $y$, and $x$ represents the total number of cases in the group or subgroup under consideration. The variance of $r$ is computed using the formula given below, with the standard error being the square root of the variance:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1-f}{x^{2}} \sum_{h=1}^{H}\left[\frac{m_{h}}{m_{h}-1}\left(\sum_{i=1}^{m_{h}} z_{h i}^{2}-\frac{z_{h}^{2}}{m_{h}}\right)\right]
$$

in which

$$
z_{h i}=y_{h i}-r x_{h i}, \text { and } z_{h}=y_{h}-r x_{h}
$$

where $h$ represents the stratum, which varies from 1 to $H$,
$m_{h}$ is the total number of clusters selected in the $h^{\text {th }}$ stratum,
$y_{h i}$ is the sum of the weighted values of variable $y$ in the $i^{t h}$ cluster in the $h^{\text {th }}$ stratum,
$x_{h i} \quad$ is the sum of the weighted number of cases in the $i^{t h}$ cluster in the $h^{\text {th }}$ stratum, and
$f$ is the overall sampling fraction, which is so small that it is ignored.
The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-4 sample for Meghalaya, there were 344 clusters. Hence, 344 replications were created. The variance of a rate $r$ is calculated as follows:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1}{k(k-1)} \sum_{i=1}^{k}\left(r_{i}-r\right)^{2}
$$

in which

$$
r_{i}=k r-(k-1) r_{(i)}
$$

where $r$ is the estimate computed from the full sample of 344 clusters,
$r_{(i)}$ is the estimate computed from the reduced sample of 343 clusters ( $i^{\text {th }}$ cluster excluded), and
$k \quad$ is the total number of clusters.
In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ) for each estimate are also computed.

Sampling errors for NFHS-4 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Meghalaya as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A. 2 presents the value of the statistic (R), its standard error (SE), the number of unweighted ( N ) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ); for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1 ).

Table A. 1 List of variables for sampling errors, Meghalaya, 2015-16

| Variable | Estimate | Base population |
| :---: | :---: | :---: |
| HOUSEHOLDS |  |  |
| Using an improved source of drinking water | Proportion | Households |
| Using an improved sanitation facility | Proportion | Households |
| Using iodized salt | Proportion | Households |
| Sex ratio (females per 1,000 males) | Ratio | De facto household population, all ages |
| WOMEN |  |  |
| No schooling (Females age 6 years and above) | Proportion | De facto household population of females age 6 and above |
| Urban residence | Proportion | Women age 15-49 |
| No schooling (Women age 15-49) | Proportion | Women age 15-49 |
| Completed 10 or more years of schooling | Proportion | Women age 15-49 |
| Never married, including married gauna not performed | Proportion | Women age 15-49 |
| Currently married | Proportion | Women age 15-49 |
| Married before age 18 | Proportion | Women age 20-49 |
| Currently using any contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using a modern contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using a traditional contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using pill | Proportion | Currently married women age 15-49 |
| Currently using IUD/PPIUD | Proportion | Currently married women age 15-49 |
| Currently using condom/Nirodh | Proportion | Currently married women age 15-49 |
| Currently using female sterilization | Proportion | Currently married women age 15-49 |
| Using public health sector source of contraception | Proportion | Women age 15-49 currently using modern methods of contraception |
| Unmet need for family planning | Proportion | Currently married women age 15-49 |
| Want no more children | Proportion | Currently married women age 15-49 |
| Want to delay next birth at least 2 years | Proportion | Currently married women age 15-49 |
| Mother received four or more antenatal care (ANC) visits | Proportion | Women with at least one birth in last five years (last birth) |
| Took iron and folic acid (IFA) for 100 days or more | Proportion | Women with at least one birth in last five years (last birth) |
| Birth registration | Proportion | De jure children under age 5 years |
| Births delivered by a health personnel | Proportion | Births in last 5 years |
| Institutional delivery | Proportion | Births in last 5 years |
| Postnatal check for mother within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Postnatal check for newborn within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Exclusive breastfeeding | Proportion | Children under age 6 months |
| Children with diarrhoea | Proportion | Children under age 5 years |
| Treated with oral rehydration salt (ORS) packets | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Children with diarrhoea taken to a health provider | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Child received BCG vaccination | Proportion | Children age 12-23 months |
| Child received DPT vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received polio vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received measles vaccination | Proportion | Children age 12-23 months |
| Child received hepatitis B vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child with all basic vaccinations | Proportion | Children age 12-23 months |
| Children given vitamin A supplement in past 6 months | Proportion | Children age 9-59 months |
| Height-for-age, stunting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-height, wasting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-age, underweight (below -2SD) | Proportion | Children under age 5 years who were measured |
| Children with any anaemia | Proportion | Children age 6-59 months with an anaemia test |
| Women with any anaemia | Proportion | Women age 15-49 with an anaemia test |
| Body mass index (BMI) $<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women age 15-49 who were measured |
| Body mass index (BMI) $\geq 25.0 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women age 15-49 who were measured |
| Have heard of HIV/AIDS | Proportion | Women age 15-49 |
| Have comprehensive knowledge about HIV/AIDS | Proportion | Women age 15-49 |
| Ever experienced physical or sexual violence | Proportion | Women age 15-49 |
| Total fertility rate (last 3 years) | Rate | Women |
| Neonatal mortality | Rate | Births in last 5 years |
| Postneonatal mortality | Rate | Births in last 5 years |
| Infant mortality | Rate | Births in last 5 years |
| Child mortality | Rate | Births in last 5 years |
| Under-five mortality | Rate | Births in last 5 years |
| MEN |  |  |
| No schooling (Males age 6 years and above) | Proportion | De facto household population of males age 6 and above |
| Urban residence | Proportion | Men age 15-49 |
| No schooling (Men age 15-49) | Proportion | Men age 15-49 |
| Completed 10 or more years of schooling | Proportion | Men age 15-49 |
| Never married, including married gauna not performed | Proportion | Men age 15-49 |
| Currently married | Proportion | Men age 15-49 |
| Married before age 21 | Proportion | Men age 25-49 |
| Want no more children | Proportion | Currently married men age 15-49 |
| Want to delay next birth at least 2 years | Proportion | Currently married men age 15-49 |
| Men with any anaemia | Proportion | Men age 15-49 with an anaemia test |
| Body mass index (BMI) $<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Men age 15-49 who were measured |
| Body mass index (BMI) $\geq 25.0 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Men age 15-49 who were measured |
| Have heard of HIVIAIDS | Proportion | Men age 15-49 |
| Have comprehensive knowledge about HIV/AIDS | Proportion | Men age 15-49 |

    ${ }^{1}$ Females per 1,000 males
    ${ }^{2}$ Population age 6 and above

[^1]:    $B P L=$ Below poverty line
    ${ }^{1}$ Cows, bulls, buffaloes, camels, horses, donkeys, mules, goats, sheep, chickens, or ducks
    ${ }^{2}$ Percentage of households in which any usual member of the household has a bank account/post office account
    ${ }^{3}$ Percentage of households in which any usual member of the household is covered by a health scheme/health insurance

[^2]:    Note: In this table, children's age refers to their age at the start of the 2014-15 school year (assumed here to be April 2014).
    ( ) Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^3]:    Note: Total includes women who don't know their caste/tribe, who are not shown separately.
    ( ) Based on 125-249 unweighted woman-years of exposure

    * Based on fewer than 25 unweighted cases

[^4]:    Note: Women who have been sterilized or whose husband has been sterilized are considered to want no more children. Men who are sterilized or who mention in response to the question about desire for children that their wife has been sterilized are considered to want no more children.
    na $=$ Not applicable
    ${ }^{1}$ Includes current pregnancy of woman/wife
    ${ }^{2}$ Excludes pregnant women and men with pregnant wives
    () Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^5]:    Note: Table excludes women and men who gave non-numeric responses to the questions on ideal number of children or ideal number of sons or daughters.
    () Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^6]:    Note: Total includes Muslim women and women who don't know their caste/tribe, who are not shown separately.
    ${ }^{1}$ Includes nongovernmental organizations or trust hospitals/clinics
    ${ }^{2}$ Not a Hindu, Muslim, or Christian
    () Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^7]:    Note: Total includes women belonging to an other backward class and women who don't know their caste/tribe, who are not shown separately.
    TT = Tetanus toxoid; IFA = Iron and folic acid
    ${ }^{1}$ Includes mothers with two injections during the pregnancy for her last birth, or two or more injections (the last within 3 years of the last live birth), or three or more injections (the last within 5 years of the last birth), or four or more injections (the last within 10 years of the last live birth), or five or more injections at any time prior to the last birth
    ${ }^{2}$ Full antenatal care includes having received at least four antenatal care visits, having received at least one TT injection ,and having taken IFA tablets or syrup for 100 or more days
    ${ }^{3}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
    ( ) Based on 25-49 unweighted cases

[^8]:    Note: Total includes pregnancies of women belonging to an other backward class and women who don't know their caste/tribe, which are not shown separately.
    ${ }^{1}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
    ( ) Based on 25-49 unweighted cases

[^9]:    Note: Total includes children belonging to an other backward class and children whose caste/tribe is not known, who are not shown separately.
    ${ }^{1}$ Symptoms of ARI (cough accompanied by short, rapid breathing or difficulty breathing which was chest related)
    ${ }^{2}$ Excludes pharmacy, shop, and traditional healer
    ${ }^{3}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
    () Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^10]:    * Percentage not shown; based on fewer than 25 unweighted cases

[^11]:    Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Total includes children belonging to an other backward class and children whose caste/tribe is not known, who are not shown separately.
    ${ }^{1}$ Excludes children whose mothers were not interviewed
    ${ }^{2}$ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
    ${ }^{3}$ Not belonging to a scheduled caste, scheduled tribe, or other backward class
    ${ }^{4}$ Includes children whose mothers are deceased
    ${ }^{5}$ Mildly anaemic is classified as $10.0-11.9 \mathrm{~g} / \mathrm{dl}$ for non-pregnant women and $10.0-10.9 \mathrm{~g} / \mathrm{dl}$ for pregnant women. Moderately/severely anaemic is $<10.0 \mathrm{~g} / \mathrm{dl}$. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known. () Based on 25-49 unweighted cases

[^12]:    Note: The body mass index ( BMI ) is expressed as the ratio of weight in kilograms to the square of height in meters $\left(\mathrm{kg} / \mathrm{m}^{2}\right)$. na $=$ Not applicable
    ${ }^{1}$ Excludes pregnant women and women with a birth in the preceding 2 months
    ( ) Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^13]:    Note: Table is based on women and men who stayed in the household the night before the interview. Prevalence is adjusted for altitude and for smoking status, if known, using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29).
    Haemoglobin in $\mathrm{g} / \mathrm{dl}=$ grams per decilitre.
    na $=$ Not applicable
    ${ }^{1}$ For pregnant women the value is $10.0-10.9 \mathrm{~g} / \mathrm{dl}$
    ${ }^{2}$ For pregnant women the value is $<11.0 \mathrm{~g} / \mathrm{dl}$
    ( ) Based on 25-49 unweighted cases
