## INTRODUCTION

The 2005-06 National Family Health Survey (NFHS-3) is the third in the NFHS series of surveys. The first NFHS was conducted in 1992-93, and the second (NFHS-2) was conducted in 1998-99. All three NFHS surveys were conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-3 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation, UNICEF, UNFPA, and the Government of India. Technical assistance for NFHS-3 was provided by Macro International, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

The survey provides trend data on key indicators and includes information on several new topics, such as HIV/AIDS-related behaviour, attitudes toward family life education for girls and boys, use of the Integrated Child Development Services (ICDS) programme, men's involvement in maternal care, and health insurance. For the first time, NFHS-3 provides information on men and unmarried women. In addition, NFHS-3 provides estimates of HIV prevalence for India as a whole based on blood samples collected in every state in the country, including Uttarakhand. Separate HIV estimates are also provided for Andhra Pradesh, Karnataka, Maharashtra, Manipur, Tamil Nadu, and Uttar Pradesh.

In Uttarakhand, the survey is based on a sample of 2,659 households that is representative at the state level and for urban and rural areas in the state. NFHS-3 interviewed 2,953 women age 15-49 from all the selected households and 983 men age 15-54 from a subsample of households to obtain information on population, health, and nutrition in the state. In addition to the interviews, height and weight measurements were taken for all children under age six years in the sample households and all interviewed women and men. Haemoglobin levels were measured for all interviewed women and men and for all children age 6-59 months. In a subsample of households, all interviewed women and men were eligible to have their blood collected for HIV testing. Biomarkers were measured only after obtaining informed consent. The NFHS-3 fieldwork in Uttarakhand was conducted by Taleem Research Foundation, Ahmedabad, from April to July 2006.

This report presents the key findings of the NFHS-3 survey in Uttarakhand, followed by detailed tables and an appendix on sampling errors. More information about the definitions of indicators included in this report is contained in Volume I of the NFHS-3 National Report, and the questionnaires and details of the sampling procedure for NFHS-3 are contained in Volume II of the NFHS-3 National Report (available at http://www.nfhsindia.org).

## Household Characteristics

## Household composition

More than one-fourth ( $28 \%$ ) of Uttarakhand's households are in urban areas, and the remaining ( $72 \%$ ) are in rural areas. On average, households in Uttarakhand are comprised of five members. About 1 in 6 households ( $16 \%$ ) are headed by women.

The vast majority of households in Uttarakhand have household heads who are Hindu (87\%). Seven percent have Muslim household heads and 5 percent have Sikh household heads. All other religions account for less than 1 percent of household heads.

Twenty-one percent of households belong to a scheduled caste, 3 percent belong to a scheduled tribe, and 15 percent belong to other backward classes (OBC). Sixty-two percent of Uttarakhand's households do not belong to scheduled castes, scheduled tribes, or other backward classes.

Thirty-five percent of the population in Uttarakhand is under age 15; only 6 percent is age 65 and over.

Among children under 18 years of age, 6 percent have experienced the death of one or both parents. In all, 84 percent of children under 18 years of age live with both parents and 14 percent live with one parent.

## Housing characteristics

Half of households in Uttarakhand live in a pucca house. Eighty percent of households (95\% of urban households and $74 \%$ of rural households) have electricity, up from 53 percent at the time of NFHS-2. Fifty-seven percent of households have toilet facilities, up from 39 percent at the time of NFHS-2. In rural areas, 58 percent of households do not have any toilet facilities.

In rural areas of Uttarakhand, $58 \%$ of households
do not have any toilet facilities.

Eighty-seven percent of households use an improved source of drinking water (99\% of urban households and $83 \%$ of rural households), but only 44 percent have water piped into their dwelling, yard, or plot. Twenty-one percent of households treat their drinking water to make it potable; 49 percent of those that treat their water use ceramic, sand, or other water filter and 43 percent boil the water.

## Wealth index

The wealth index is constructed by combining information on 33 household assets and housing characteristics such as ownership of consumer items, type of dwelling, source of water, and availability of electricity into a single index. The household population is divided into five equal groups of 20 percent each (quintiles) at the national level from 1 (lowest, poorest) to 5 (highest, wealthiest). Since the quintiles of the wealth index are defined at the national level, the proportion of the population of a particular state that falls in any specific quintile will vary across states.

## Wealth Index

Percentage of households in urban and rural areas and percent distribution of households by wealth quintile

One-third of Uttarakhand's households and population are in the highest wealth quintile, and 7 percent of households (with $6 \%$ of the population) are in the lowest wealth quintile. Nine percent of rural households are in the lowest wealth quintile and only 19 percent are in the highest wealth quintile. By contrast, in urban areas, only 2 percent of households are in the lowest wealth quintile, whereas 67 percent are in the highest wealth quintile.

## EDUCATION

## Current school attendance among children

Ninety-four percent of primary-school age children (6-10 years) attend school ( $89 \%$ in urban areas and $95 \%$ in rural areas). School attendance drops to 86 percent for children age 11-14 years and is only 55 percent for children age 15-17 years.

Gender disparity in education is evident in the school age population, with 78 percent of girls age 6-17 years attending school, compared with 86 percent of boys in the same age group. Among children age 6-10 years, there is very little gender disparity in school attendance between boys and girls. At ages 11-14 years, gender disparity in favour of boys is not high in urban

Are there gender differentials in children's current school attendance?
Percentage of children attending school by age

areas (4 percentage points), but is 8 percentage points in rural areas. At age 15-17 years, school attendance is actually 14 percentage points higher for girls than boys in urban areas, but in rural areas is 21 percentage points lower for girls than for boys.

## Literacy and educational attainment

Thirty-three percent of women and 12 percent of men age 15-49 have never attended school. More than 2 in 5 men ( $45 \%$ ) have completed 10 or more years of education, but only 34 percent of women have attained that level of education.

In NFHS-3, literate persons are those who have either completed at least standard six or passed a simple literacy test conducted as part of the survey. According to this measure, 65 percent of women and 86 percent of men age 15-49 are literate in Uttarakhand.

## Attitudes toward family life education in school

Virtually all women and men in Uttarakhand agree that children should be taught moral values in school. Most adults also think that children should learn about the changes in their own bodies during puberty, but fewer adults think that children should learn about pubertyrelated changes in the bodies of the opposite sex. Men and women differ somewhat on whether they think that children should be taught about contraception in school. Men are more likely to think that girls and boys should learn about contraception in school than women. Seventy-nine percent of men believe that both girls and boys should be taught about contraception in school, compared with about half of women who believe that girls should learn about contraception in school and only one-third who believe that boys should learn about contraception in school.

Nearly two-thirds of women and more than 90 percent of men believe that information on HIV/AIDS should be part of the school curriculum. Three-quarters of men feel that both boys and girls should be taught about sex and sexual behaviour in school, while less than half of women feel that this is an appropriate topic for school children.

## Fertility

## Age at first marriage

The median age at first marriage among women age 25-49 in Uttarakhand is 18 years. Men get married six years later, at a median age of 24 years. Almost one-quarter ( $23 \%$ ) of women age 20-24 years got married before the legal minimum age of 18 and 21 percent of men age 25-29 years got married before the legal minimum age of 21 .

## Fertility levels

At current fertility levels, a woman in Uttarakhand will have an average of 2.6 children in her lifetime, almost half a child more than the replacement level of fertility. Fertility has remained unchanged since the time of NFHS-2.

Fertility in rural areas is 2.7 children per woman, 0.5 children higher than in urban areas where the fertility rate of 2.2 children per woman is close to the replacement level.

Fertility rates are higher for women in disadvantaged groups ( 2.8 children per woman
 among scheduled castes and 2.5 among other backward classes), compared with women who are not in any of these groups (2.4).

Total Fertility Rate by State
Children per woman

Fertility in<br>Uttarakhand is<br>close to the<br>national<br>average, and is<br>half a child<br>higher than<br>replacement<br>level fertility.

The largest differentials in fertility are by education and wealth. At current fertility rates, women with no education will have 3.6 children compared with only 2.0 children among women with 10 or more years of schooling. Women in the highest wealth quintile will also have a total fertility rate of only 2.0 , much lower than that for women in other quintiles.

## How does fertility vary with education and household wealth?

Total fertility rate (children per woman)

Education

Wealth index

Note: Categories with fewer than 125 unweighted woman-years of exposure are not shown.

## Teenage pregnancy

Among young women age 15-19, 6 percent have already begun childbearing, much lower than the national average. Young women in rural areas ( $8 \%$ ) are four times as likely to be mothers as young women in urban areas ( $2 \%$ ). While no women age 15 have yet begun childbearing, by age 19,16 percent of women have already had a birth or are pregnant with their first child.

## Birth intervals

The median interval between births in Uttarakhand is 32 months, one month longer than the national average. Thirteen percent of births occur within 18 months of the previous birth and 28 percent occur within 24 months. Three out of five births ( $59 \%$ ) occur within three years. Research shows that waiting at least three years between children reduces the risk of infant mortality.

## Fertility preferences

Three-fourths of currently married women (75\%) and men (73\%) in Uttarakhand want no more children, are already sterilized, or have a spouse who is sterilized. Among those who do want another child, 45 percent of women and men would like to wait at least two years. Seventy-six percent of women and 83 percent of men consider the ideal family size to be two children or less.

There is a strong preference for sons in Uttarakhand. About one in five women and one in seven men in Uttarakhand want more sons than daughters, but only a negligible proportion of women ( $2 \%$ ) and men (1\%) want more daughters than sons. However, most men and women would like to have at least one son and at least one daughter.

The desire for more children is strongly affected by women's number of sons. For example, among women with two children, those with one or two sons are more than one and a half times as likely to want no more children as those with two daughters. Notably, however, the proportion of currently married women with two children who want no more children ( $86 \%$ ) is substantially higher in NFHS-3 than it was in NFHS-2 (72\%), irrespective of women's number of sons.

If all women in Uttarakhand were to have only the number of children they wanted, the total fertility rate would be 1.8 instead of 2.6 .

## Family Planning

## Knowledge of family planning methods

Knowledge of contraception is almost universal in Uttarakhand. Female sterilization is the most widely known method, known by more than 90 percent of all women and men.

How does son preference affect women's desire for children?
Percentage of currently married women with two children who want no more children

Among currently married women, 93 percent now know about the pill, compared with 77 percent in NFHS-2. Eighty percent now know about the IUD, compared with 68 percent in NFHS-2.

## Contraceptive use

The contraceptive prevalence rate among currently married women is 59 percent, up from 43 percent in NFHS-2. Contraceptive use is higher among women in the age group 30-39 years than among younger or older women. The contraceptive prevalence rate is 65 percent in urban areas while in rural areas it is only 57 percent.

Contraceptive use increases rapidly by wealth, from only 45 percent for women in the lowest wealth quintile to 68 percent for women in the highest wealth quintile. Muslim women and scheduled-caste women are somewhat less likely to use family planning methods than women in other religious or caste/tribe groups.

How many women use family planning? Percentage of currently married women

Contraceptive Prevalence Rate by State Percentage of currently married women

With a 16 percentage point increase in current contraceptive use since NFHS-2, 3 in 5 currently married women are using contraception.

Women in Uttarakhand are more likely to use contraception if they already have a son. For example, among women with two children, only 41 percent of women with two daughters and no sons use a method of family planning, compared with 71 percent of women with one or more sons.

Female sterilization accounts for more than half (54\%) of contraceptive use, down from 63 percent in NFHS-2.

Condoms are the most commonly used spacing method (used by 16 percent of currently married women). Four percent of women use pills. In general, better-educated and wealthier women and women in urban areas are more likely than other women to use spacing methods. For example, 41 percent of women with 10 or more years of education use the pill, IUD, or condom, compared with only 11 percent of women with no education. Female sterilization is more common among less-educated women. Traditional contraceptive methods are used by only 4 percent of currently married women.

Contraceptive use at last sex as reported by men is lower ( $52 \%$ ) than women's reports of current contraceptive use (59\%). Men are more likely than women to report current use of condoms, however.

Ninety-four percent of sterilized women had the operation in a government facility. An almost equal proportion of IUD users had their IUD insertion in the public ( $46 \%$ ) and private ( $45 \%$ ) medical sectors. More than half of pill users got their most recent supply from the private medical sector, which is also the most common source for condoms. Among those for whom the brand is known, the majority of women using pills ( $57 \%$ ) use social marketing brands.

The one-year discontinuation rate for family planning in Uttarakhand (28\%) is about the same as the rate in India as a whole ( $27 \%$ ). Discontinuation rates for temporary methods are quite high. Thirty-seven percent of users of temporary methods discontinued
 use within the first year after they adopted the method. Nearly half of the users of pills (45\%) and one-third of condom users ( $34 \%$ ) discontinued use within the first year of use.

## Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method they prefer. More than one-third (37\%) of modern contraceptive users were told about the side effects of their method when they started using it
although only 29 percent were told what to do if side effects occurred. Only one in four modern contraceptive users were ever told by a health or family planning worker about other methods they could use.

## Men's attitudes

Most men in Uttarakhand reject the idea that contraception is women's business and a man should not have to worry about it and reject the idea that women using contraception may become promiscuous ( $93 \%$ each). However, 50 percent of men incorrectly believe that women who are breastfeeding cannot become pregnant. About four-fifths of men know that a condom, if used correctly, protects against pregnancy most of the time.

## Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely but are not using contraception. According to this definition, 11 percent of married women in Uttarakhand have an unmet need for family planning, down from 21 percent in NFHS-2. Since NFHS-2, unmet need for limiting and unmet need for spacing have declined by $4-6$ percentage points. Currently, 85 percent of the demand for family planning is being met, up from 67 percent in NFHS-2.

## Infant and Child Mortality

The infant mortality rate in Uttarakhand has remained almost constant over time. Infant mortality is currently estimated at 42 deaths before the age of one year per 1,000 live births, slightly up from the NFHS-2 estimate of 38 . One in 24 children dies within the first year of life, and 1 in 18 dies before reaching age five. Infant mortality is three times higher in rural areas than in urban areas, and mortality of all children under age five is more than twice as high in rural areas as in urban areas.

While girls and boys experience the same level of infant mortality ( 55 per 1,000 live births), girls experience much higher postneonatal mortality than do boys, and boys experience higher neonatal mortality than do girls.

Children born to mothers younger than age 20 are more likely to die in infancy than children born to mothers in the prime childbearing age of 20-29 years. The infant mortality rate is 82 per 1,000 for teenage mothers, compared with 50 per 1,000 for mothers age 20-29.

Having children too close together is especially risky. The risk of death in the first year of life is more than two times higher for children born less than two years after a previous birth than for children whose mothers waited four or more years between births.

Children living in the highest wealth quintile households are much less likely to die before their first birthday as children living in other wealth quintile households. Similarly, children whose mothers have no education are thrice as likely to die before their first birthday as children whose mothers have completed at least 10 years of school. In addition, infant mortality rates among scheduled castes and other backward classes are higher than the rate among those who do not belong to scheduled caste, scheduled tribe, or other backward classes.

Infant Mortality Rate by State
Deaths per 1,000 live births

The infant mortality rate in Uttarakhand is lower than the national average, but is higher than mortality in 12 other states.

## Perinatal Mortality

Perinatal mortality, which includes stillbirths and very early infant deaths (in the first week of life), is estimated at 38 deaths per 1,000 pregnancies that lasted 7 months or more (data on perinatal mortality not shown in tables).

## Maternal Health

## Antenatal care

Among women who gave birth in the five years preceding the survey, 60 percent received antenatal care from a health professional $(48 \%$ from a doctor and $12 \%$ from an ANM/LHV/nurse/midwife or other health personnel) for their last birth. One-quarter of women did not receive any antenatal care. Nine in 10 women with 10 or more years of education and in the highest wealth quintile received antenatal care. Eighty percent of urban women received antenatal care from a health professional, compared with 53 percent of rural women.

Three or More Antenatal Care Visits by State
Percentage of last births in the past five years

> Fewer than half of mothers in Uttarakhand received at least three antenatal care visits for their last birth, lower than the national average.

Forty-three percent of women received antenatal care during the first trimester of pregnancy, as is recommended. Another 17 percent had their first visit during the fourth or fifth month of pregnancy (data not shown in tables). Forty-five percent of mothers had three or more antenatal care visits. Urban women were much more likely to have three or more visits ( $72 \%$ ) than rural women ( $36 \%$ ).

For 63 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 26 percent consumed IFA for the recommended 90 days or more. More than two-thirds of mothers (69\%) received two or more doses of tetanus toxoid vaccine during the pregnancy. Only 3 percent took a deworming drug during pregnancy.

Even when women do receive antenatal care, they often do not receive all the services needed to monitor their pregnancy. Only about half of women who received ANC had their weight taken, their blood pressure taken, their urine tested, and their blood tested. Thirty-nine percent did not even have their abdomen examined.

An ultrasound test was performed during 23 percent of pregnancies in the five years preceding the survey, very close to the national average of 24 percent. Women with at least 10 years of education were nearly five times as likely to have an ultrasound test as women with no education. Only 9 percent of births among women in the lowest wealth quintile had an ultrasound test, compared with 49 percent among women in the highest wealth quintile.

## Delivery care

Two-thirds of the births in Uttarakhand take place at home. However, the percentage of births delivered in a health facility has increased from 21 percent in NFHS-2 to 36 percent in NFHS-3 (among births in the three years prior to the survey). Home births are more common among women who received no antenatal check-ups, older women, women with less education, women in the three lowest wealth quintiles, and women with more than three previous births.

In 84 percent of home births, a clean blade was used to cut the cord, as is recommended, but only

60 percent of home births followed the recommendation that the baby be immediately wiped dry and then wrapped without being bathed first.

Almost half ( $48 \%$ ) of births during the past five years were assisted by a traditional birth attendant; only two-fifths of births were assisted by a health professional. Twelve percent were delivered by friends or relatives. A disposable delivery kit (DDK) was used for only 23 percent of home births.

Institutional Delivery by State
Percentage of births in the past five years

| The percentage |
| :---: |
| of births in |
| Uttarakhand |
| delivered in a |
| health facility |
| is somewhat |
| lower than the |
| national |
| average. |

## Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. Only one-third of mothers in Uttarakhand (32\%) had a postnatal check-up within two days of birth, as is recommended. About two-thirds of women ( $63 \%$ ) received no postnatal care at all. Postnatal care is most common following births in a medical facility; however, about one-fifth of births in medical facilities were not followed by a postnatal checkup of the mother. Only 12 percent of home births were followed by a postnatal check-up.

## Male involvement in maternal care

Fifty-five percent of men with a child under three years said they were present during at least one antenatal check-up received by the child's mother ( $76 \%$ in urban areas and $46 \%$ in rural areas); and only 30 percent were told what to do if the mother had a pregnancy complication.

Only 3 in 10 fathers with a child less than three years of age were provided information related to specific aspects of maternal care. About one-third were told about the importance of proper nutrition for the mother during pregnancy and about the same percentage were told about the
importance of delivering the baby in a health facility. Among fathers whose child was not delivered in a health facility, only 51 percent were told about the importance of using a new or unused blade to cut the umbilical cord, 45 percent were told about the importance of cleanliness at the time of delivery, 34 percent were told about the importance of breastfeeding the baby immediately after the birth, and only 28 percent were told about keeping the baby warm immediately after birth.

## Child Health

## Vaccination of children

Sixty percent of children age 12-23 months are fully vaccinated against six major childhood illnesses: tuberculosis, diphtheria, pertussis, tetanus, polio, and measles. However, most children are at least partially vaccinated: only 9 percent have received no vaccinations at all.

Most, but not all children ( $84 \%$ ) have received a BCG vaccination. However, fewer children received at least three doses of polio vaccine $(80 \%)$, and even fewer received at least the recommended three DPT injections ( $67 \%$ ). Seven in 10 children ( $72 \%$ ) have been vaccinated against measles. The DPT and polio vaccines are given in a series. Many children receive the first dose but do not finish the series. Between the first and third doses, the dropout rate for polio is 10 percent and the dropout rate for DPT is 18 percent.

There has been an increase in full vaccination coverage between NFHS-2 (41\%) and NFHS-3 $(60 \%)$. The coverage of each of the vaccines has increased by 1-18 percentage points between NFHS-2 and NFHS-3. In spite of the Pulse Polio Campaign which is attempting to eradicate the disease in India, one-fifth of children

Trends in Vaccination Coverage
Percentage of children 12-23 months receiving vaccinations

in Uttarakhand still have not received three doses of polio vaccine.

Children in urban areas, children of educated mothers, children in wealthier households, and children not belonging to a scheduled caste, scheduled tribe, or other backward classes are more likely than other children to have received all the recommended vaccinations. The percentage of fully vaccinated children differs only marginally by sex. Nevertheless, a higher percentage of boys than girls have received each individual vaccine.

Full Immunization Coverage by State
Percentage of children 12-23 months

Full immunization coverage in Uttarakhand is higher than the national average but 2 in 5 children are still not fully immunized.

## Childhood illnesses

In the two weeks before the survey, 4 percent of children under age five had symptoms of an acute respiratory infection (cough and short, rapid breathing that was chest-related and not due to a blocked or runny nose). Of these children, 74 percent were taken to a health facility or health provider and 46 percent received antibiotic drugs.

Seventeen percent of children under age five were reported to have had fever in the two weeks preceding the survey; 65 percent of these children were taken to a health facility or provider for treatment, and 4 percent received antimalarial drugs.

Overall, 13 percent of children had diarrhoea in the two weeks preceding the survey. Among these children, 62 percent were taken to a health facility. Fifty-three percent were treated with some kind of oral rehydration therapy (ORT) or increased fluids, including 33 percent who were treated with a solution prepared from oral rehydration salt (ORS) packets and 30 percent who were given gruel. One in six children with diarrhoea ( $17 \%$ ) did not receive any type of treatment at all. Fourteen percent received antibiotics, which are not normally recommended for treating childhood diarrhoea.

Children should receive more fluids than usual during diarrhoeal illness, but in Uttarakhand only 17 percent received more liquids than normal. More than a quarter of children with diarrhoea $(28 \%)$ received either less to drink than normal or did not receive any liquids, which can increase the risk of dehydration.

## Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based anganwadi centres (AWC).

Among the 73 percent of children under age six who are in areas covered by an anganwadi centre, only 32 percent receive services of some kind from a centre. The most common services children under age six receive are supplementary food ( $28 \%$ ), immunization ( $14 \%$ ), and health check-ups ( $10 \%$ ). Only one-fifth of children age 3-5 years receive early childhood care or preschool education. Only 13 percent of children age 0-59 months in areas served by an anganwadi centre have had their weight measured in an AWC.

Children from rural areas are more likely to take advantage of services offered at anganwadi centres than children from urban areas. Muslim children are less likely than Hindu children to take advantage of these services. Children of the poorest and wealthiest households, and children belonging to other backward classes are less likely to take advantage of these services.

## Breastreeding, Nutrition, and Anaemia

## Infant feeding

Although breastfeeding is nearly universal in Uttarakhand, only 31 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. In addition, only 71 percent are put to the breast within the first day of life, which means many infants are deprived of the highly nutritious first milk (colostrum) and the antibodies it contains. However, mothers in Uttarakhand breastfeed for an average of 25 months, thus meeting the minimum duration of 24 months as recommended by WHO for most children.

It is recommended that nothing be given to children other than breast milk in the first three days when the milk has not begun to flow regularly. However, almost half of children (45\%) are given something other than breast milk during that period.

WHO offers three recommendations for infant and young child feeding (IYCF) practices for children 6-23 months old: continued breastfeeding or feeding with appropriate calcium-rich foods if not breastfed; feeding solid or semi-solid food for a minimum number of times per day according to age and breastfeeding status; and including foods from a minimum number
of food groups per day according to breastfeeding status. Only two-fifths of children (40\%) age 6-23 months are fed the recommended minimum times per day and only about half are fed from the minimum number of food groups. Only a quarter of children ( $26 \%$ ) are fed according to all three recommended practices.

Vitamin A deficiency can cause eye damage and a higher risk of dying from measles, diarrhoea, or malaria. The Government of India recommends that children under three years receive vitamin A supplements every six months, starting at age 9 months. However, only one in five last-born children age 12-35 months was given a vitamin A supplement in the past six months, and only 53 percent of children age 6-35 months ate vitamin A-rich foods the day or night before the interview.

Eating foods rich in iron and taking iron supplements can prevent anaemia. Only 13 percent of children age 6-35 months ate iron-rich foods during the day or night before the interview, and only 4 percent of children age 6-59 months were given iron supplements in the week before the interview.

## Children's nutritional status

Forty-four percent of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Almost one in five (19\%) are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness. Thirty-eight percent are underweight, which takes into account both chronic and acute undernutrition.

Even during the first six months of life, when most babies are breastfed, 29 percent of children are stunted, 24 percent are wasted, and 31 percent are underweight. Children in rural areas are more likely to be undernourished, but even in urban areas, more than one-quarter ( $27 \%$ ) of children suffer from chronic undernutrition. Girls and boys are almost equally likely to be undernourished.

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

Children's nutritional status in Uttarakhand has improved substantially since NFHS-2 according to two of the three nutritional status measures. Among children under age three years (the age group for which nutritional status data are available in NFHS-2), stunting decreased from 53 percent to 40 percent between NFHS-2 and NFHS-3 and underweight decreased from 36 percent to 32 percent. However, because stunting improved more rapidly than underweight, the prevalence of wasting actually increased during that period (from $9 \%$ to $18 \%)$. Despite the improvements over time in stunting and underweight, undernutrition is still a major problem in Uttarakhand.

## Adults' nutritional status

Adults in Uttarakhand suffer from a dual burden of malnutrition; 30 percent of women and 28 percent of men are too thin, and 13 percent of women and 8 percent of men are overweight or obese. Only 57 percent of women and 64 percent of men are at a healthy weight for their height.

Undernutrition is particularly serious in rural areas, in the lower wealth quintiles, and among teenagers.

Overweight and obesity are most common in older adults, those in urban areas, those who are well educated, and those in the highest wealth quintile. Because population groups that are less likely to be too thin are the same groups that are more likely to be overweight or obese, differentials in the percentage suffering from either of these two nutritional problems are relatively small across most groups.

Using iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Less than half

How many women are at a healthy weight for their height?
Percent distribution of women
 of households in Uttarakhand ( $46 \%$ ) were using sufficiently iodized salt at the time of the survey. This is less than the percentage observed during NFHS-2 (60\%). However, a nationwide ban on non-iodized salt took effect just as the NFHS-3 fieldwork was being completed, so the effects of the new law could not be determined by the survey.

## Anaemia

Anaemia is a major health problem in India, especially among women and children. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Among children between the ages of 6 and 59 months, the great majority - 61 percent-are anaemic. This includes 29 percent who are mildly anaemic, 31 percent who are moderately anaemic, and 2 percent who suffer from severe anaemia. Boys and girls are equally likely to have anaemia. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. Even among children in wealthiest households and children whose mothers have at least 10 years of education, half of the children are anaemic.

Anaemia among women, men, and children

More than half of women in Uttarakhand (55\%) have anaemia, including 40 percent with mild anaemia, 13 percent with moderate anaemia, and 2 percent with severe anaemia. Anaemia is highest for women from scheduled tribes. More than 60 percent of Muslim women, other backward class women, the poorest women, and women who are breastfeeding are anaemic. Anaemia is more widespread among women than it was seven years ago at the time of NFHS-2, having risen by almost 10 percentage points among evermarried women. However, the anaemia level among children under age three has declined by 8 percentage points.

More than one-quarter of men in Uttarakhand (29\%) are anaemic. Anaemia increases steadily with declining wealth status and is more than three times higher for men in the lowest wealth quintile ( $49 \%$ ) than for men in the highest wealth quintile ( $14 \%$ ).

## HIVIAIDS

## Awareness of AIDS

More than two-thirds of women (69\%) in Uttarakhand have heard of AIDS ( $86 \%$ in urban areas and $63 \%$ in rural areas). Young women age 15-24 (76\%) are more likely than older women age 40-49 (58\%) to have heard of AIDS. More women know about AIDS now than in the late 1990s; among ever-married women interviewed in NFHS-2, only 36 percent knew about AIDS, compared with 64 percent of ever-married women interviewed in NFHS-3.

Men are much more likely than women to know about AIDS. In Uttarakhand, 92 percent of men have heard of AIDS. Knowledge of AIDS among males is equally widespread in urban ( $93 \%$ ) and rural ( $91 \%$ ) areas.

## Knowledge of prevention and transmission

Men in Uttarakhand are more likely than women to know how HIV is transmitted and how to keep from getting it. For example, 80 percent of men, but only 55 percent of women, know that consistent use of condoms helps prevent HIV/AIDS. More than 80 percent of men but only 60 percent of women know that having just one uninfected, faithful partner can reduce the chance of getting HIV/AIDS.

Only 29 percent of women and 48 percent of men have a 'comprehensive knowledge' of HIV/AIDS. This means they know that a

Do people know how to prevent HIVIAIDS?
Percentage of women and men age 15-49
 healthy-looking person can have HIV/ AIDS, that HIV/AIDS cannot be transmitted through mosquito bites or by sharing food, and that condom use and having only one uninfected, faithful partner can help prevent HIV/AIDS.

## HIV-related stigma

Eighty-one percent of women and 89 percent of men in Uttarakhand would be willing to take care of a family member with HIV/AIDS in their home. More than four-fifths of women (83\%) and men $(87 \%)$ say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. More than three-quarters of women $(76 \%)$ and men $(80 \%)$ say that they are comfortable buying fresh vegetables from a shopkeeper with HIV/AIDS. However, only 66 percent of women and 63 percent of men in Uttarakhand say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

HIV testing prior to NFHS-3
Only 2 percent of women and 5 percent of men in Uttarakhand age 15-49 had ever been tested for HIV prior to NFHS-3.

## HIV prevalence

In Uttarakhand, blood was collected for HIV testing from eligible women and men in a subsample of households. The results of the HIV testing of blood samples collected from Uttarakhand contributed to the national HIV prevalence estimate. However, no separate estimate of HIV prevalence is available for Uttarakhand. Nationally, 0.28 percent of adults age $15-49$ are infected with HIV, including 0.35 percent in urban areas and 0.25 percent in rural areas. If the six states considered by the National AIDS Control Organization as having high HIV prevalence are excluded, the HIV prevalence for the remaining 23 states combined, including Uttarakhand, is 0.08 percent among women age 15-49 and 0.16 percent among men age 15-49.

## Sexual Behaviour

NFHS-3 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, and condom use. Additionally, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

## Age at first sexual intercourse

About half of women in Uttarakhand have had sexual intercourse by the time they are 18 years of age, while half of men have had sexual intercourse by the time they are 24 years of age. Among youth 15-24 years of age, women are much more likely than men to have ever had sex. The earlier age at sexual intercourse for women than men is a consequence of the fact that first sexual intercourse largely occurs within marriage and women marry at younger ages than men.

## Higher-risk sex and multiple sex partners

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who have had sex in the past year, only a negligible proportion of women and 6 percent of men reported having had higher-risk sex in the past year. Even fewer respondents said they had multiple sex partners in the past year (a negligible proportion of women and $2 \%$ of men). Prevalence of higher-risk sex for women and men does not differ between urban and rural areas.

## Use of condoms during higher-risk sex

About two-thirds of men who had higher-risk sex (64\%) reported using a condom the last time they had higher-risk sex.

## Paid sex

Less than 1 percent of men said they paid for sex in the past 12 months.

## Adult Health and Health Care

## Tuberculosis

In Uttarakhand, 329 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. People who cook with solid fuels such as wood, straw, shrubs, grass, or agricultural crop waste, charcoal, and dung cakes are much more likely to have tuberculosis than people who use electricity or gas for cooking. A large majority of respondents have heard of tuberculosis ( $86 \%$ of women and $97 \%$ of men), but even among people who have heard of tuberculosis, only a little more than half of women (52\%) and 62 percent of men know that it can be spread through the air by coughing or sneezing. Forty-four percent of women and half of men have misconceptions about how TB is spread.

## Diabetes, asthma, and goitre

According to self reports, about 1 percent of women and men age 15-49 suffer from diabetes ( 825 per 100,000 women and 965 per 100,000 men). The prevalence of diabetes is much higher for women and men age 35-49 than for younger women and men. Prevalence of diabetes is higher for women and men in urban areas and in the wealthiest households. About 1 percent of adults suffer from asthma ( 537 per 100,000 women and 972 per 100,000 men). The prevalence of goitre or other thyroid disorders is slightly higher for women (257 per 100,000) than for men ( 215 per 100,000).

## Tobacco and alcohol use

Over half of men (53\%), but only 6 percent of women, use some form of tobacco. Three to 4 percent of pregnant women and breastfeeding mothers also use tobacco (data not shown in tables). Among men, tobacco use is more common in rural areas (56\%) than in urban areas ( $48 \%$ ), while among women it is the same in urban and rural areas.

Women and men are more likely to use tobacco than to drink alcohol. Less than two in five men ( $39 \%$ ) and a negligible proportion of women in Uttarakhand drink alcohol. Frequent alcohol use is even less common. Among men who drink alcohol, only 5 percent drink alcohol almost every day. The percentage of men in Uttarakhand who drink alcohol is higher than the national average ( $32 \%$ ).

## Source of health care

For most households, the private medical sector is the main source of health care ( $52 \%$ of urban households and $55 \%$ of rural households). Wealthier households are more likely to use the private medical sector than households in the lower quintiles of the wealth index. Among households that do not use government health facilities, the main reasons given for not doing so are poor quality of care ( $64 \%$ ), lack of a nearby facility ( $49 \%$ ), and long waiting time ( $37 \%$ ) (data not shown in tables).

## Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, only 7 percent of households in Uttarakhand report that they have any kind of insurance that covers at least one member of the household. Three types of programmes dominate: the Central Government Health Scheme (CGHS), the Employee State Insurance Scheme (ESIS), and a variety of private commercial health insurance schemes. Health insurance is about equally as common in urban areas as in rural areas.

## Women's Empowerment

## Employment and earnings

Less than half of currently married women age 15-49 (46\%) were employed in the last year, compared with $99 \%$ of currently married men. About three-quarters of employed women ( $76 \%$ ) work in agriculture, whereas more than two-thirds of employed men (71\%) work in non-agricultural occupations. Less than 30 percent of employed women (29\%) were paid only
in cash, 5 percent were paid in cash and in kind, and 3 percent were paid only in kind. More than 60 percent of employed women ( $64 \%$ ) were not paid for their work. Among married women who work and are paid in cash, a great majority ( $86 \%$ ) decide how their earnings will be spent, either alone or together with their husbands.

## Decision making

Married women were asked who makes decisions on their own health care, making large household purchases, making purchases for daily household needs, and visiting their own family or relatives. In Uttarakhand, 49-61 percent of currently married women participate in making each of these decisions. However, only 36 percent participate in making all four of these decisions. Women in nuclear households and women who are employed for cash are more likely to participate in these household decisions. Other groups of women who are more likely to participate in all four decisions are women in urban areas, those with 10 or more years of education, those who are 30-49 years old, and those in the highest wealth quintile.

## Other indicators of women's empowerment

More than one-third of women ( $36 \%$ ) have some money that they can decide how to use. The proportion of women with money which they control is highest for women employed for cash, with at least 10 years of education, in the highest wealth quintile, and who do not belong to a scheduled caste, scheduled tribe, or other backward class. Twenty percent of women have a bank or savings account that they themselves use, higher than the national average ( $15 \%$ ).

Women's knowledge and use of microcredit programmes is very limited. Only 14 percent of women have heard of any microcredit programme in the area and only 2 percent have ever used one.

More than half of women in Uttarakhand are allowed to go by themselves to the market (60\%) and to a health facility ( $56 \%$ ), and a little less than half ( $45 \%$ ) have the freedom to travel alone outside their own village or community (data not shown in table). Urban women, older women, women with 10 or more years of schooling, scheduled-tribe women, women who have cash earnings, and women in the highest wealth quintile have more freedom of movement than other women.

## Gender role attitudes

Fifty percent of women in Uttarakhand believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to say that wife beating is justified if a woman shows disrespect for her in-laws (39\%), she neglects the house or children (33\%), the husband suspects she is unfaithful ( $31 \%$ ), she argues with him ( $28 \%$ ), or goes out without telling him ( $27 \%$ ). Men in Uttarakhand are much less likely to agree; only 23 percent of men in Uttarakhand justify wife beating in some circumstances, including 16 percent who believe that disrespect for in-laws is justification for wife beating. Even among the wealthiest households, 39 percent of women and 14 percent of men say that a husband is justified in beating his wife for one or more specified reasons.

More than three-quarters of women and men ( $78 \%$ ) in Uttarakhand believe a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, or if she is tired or not in the mood.

## Domestic Violence

Among women age 15-49, 26 percent have ever experienced physical violence and 5 percent have ever experienced sexual violence. In all, 27 percent of women in Uttarakhand have experienced physical or sexual violence, including 33 percent of ever-married women.

## Spousal violence

Twenty-six percent of ever-married women report having been slapped by their husband; 7-14 percent report having their arm twisted or their hair pulled, being pushed, shaken, kicked, dragged, punched or beaten up, or having something thrown at them. Six percent report that their husbands have physically forced them to have sex. Overall, 28 percent of ever-married women have experienced physical or sexual violence from their current husband or if not currently married, their most recent husband. Nine percent report spousal emotional violence.

## Spousal Physical or Sexual Violence by State

 Percentage of ever-married women

> The prevalence of spousal violence is lower in Uttarakhand than in India as a whole, but is higher than in 13
> other states

Although the prevalence of spousal violence is lower among the more educated, about 1 in 10 women who have at least 10 years of education have experienced spousal physical or sexual violence. Very few ever-married women have ever initiated violence against their husband. Women whose mothers were beaten by their fathers are much more likely to be in abusive marriages themselves. Women whose husbands get drunk often are much more likely than other women to experience spousal violence.

About two in five ever-married women who experienced spousal physical or sexual violence have suffered physical injuries as a result of spousal violence. For nearly two-thirds of women who have ever experienced spousal violence, the violence first occurred within the first two years of their marriage (data not shown in tables).

## Help seeking behaviour

Only 18 percent of women who have ever experienced violence have sought help to end the violence. Sixty-eight percent of women have neither sought help nor told anyone about the violence. Abused women most often seek help from their own families. Very few women seek help from any institutional source such as the police.

Table 1 Results of the household and individual interviews
Number of households, number of interviews with women and men, and response rates, according to residence, Uttarakhand, 2005-06

| Result | Urban | Rural | Total |
| :--- | :---: | ---: | ---: |

na $=$ Not applicable
${ }^{1}$ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.
${ }^{2}$ Total percentages may add to more than 100.0 because multiple answers are allowed.
${ }^{3}$ Houses made from mud, thatch, or other low-quality materials are called kachha houses, houses that use partly low-quality and partly high-quality materials are called semi-pucca houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called pucca houses.
${ }^{4}$ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes.

Table 4 Household possessions, ownership of agricultural land, and wealth index
Percentage of urban, rural, and total households and de jure population possessing various household goods, means of transport, agricultural land, a house, and farm animals and having a bank account, health insurance, a BPL card, and a mosquito net, and percent distribution by the wealth index, Uttarakhand, 2005-06

| Household possessions | Urban | Rural | Total | De jure population |

| $20-24$ | 0.162 | 0.232 | 0.214 |  | 0.179 | 0.211 | 0.202 |  |
| $25-29$ | 0.182 | 0.154 | 0.162 |  | 0.118 | 0.171 | 0.159 |  |
| $30-34$ | 0.060 | 0.073 | 0.069 |  | 0.063 | 0.094 | 0.085 |  |
| $35-39$ | 0.013 | 0.015 | 0.015 |  | 0.007 | 0.029 | 0.023 |  |
| $40-44$ | 0.000 | 0.007 | 0.005 |  | 0.011 | 0.000 | 0.002 |  |
| $45-49$ | $*$ | 0.000 | 0.000 |  | 0.000 | 0.000 | 0.000 |  |
| TFR 15-44 | 2.21 | 2.67 | 2.55 |  | 2.14 | 2.76 | 2.61 |  |
| TFR 15-49 | 2.21 | 2.67 | 2.55 |  | 2.14 | 2.76 | 2.61 |  |
| CBR | 18.5 | 23.1 | 21.8 |  | 20.2 | 24.3 | 23.5 |  |

Note: Rates are for the period 1-36 months preceding the survey (approximately 1996-98 for NFHS-2 and 2003-05 for NFHS-3). Age-specific fertility rates are expressed per woman. Rates for the age group 45-49 might be slightly biased due to truncation.
TFR $=$ Total fertility rate, expressed per woman
CBR $=$ Crude birth rate, expressed per 1,000 population

* Rate not shown; based on fewer than 125 unweighted woman-years of exposure.

## Table 12 Fertility by background characteristics

Total fertility rates for the three years preceding the survey, percentage of women age 1549 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility rates, by background characteristics, Uttarakhand, 2005-06

| Background characteristic | Total fertility rate | Percentage currently pregnant | Mean number of children ever born to women age 40-49 years | Total wanted fertility rate |
| :---: | :---: | :---: | :---: | :---: |
| Residence |  |  |  |  |
| Urban | 2.21 | 4.3 | 3.4 | 1.62 |
| Rural | 2.67 | 5.6 | 4.2 | 1.79 |

Table 24 Source of modern contraceptive methods-Continued

|  | Female <br> sterilization |  |  |  | Condom/ <br> Male sterilization | Pill |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status.
$\mathrm{CHC}=$ Community health centre; $\mathrm{PHC}=$ Primary health centre; $\mathrm{ANM}=$ Auxiliary nurse midwife; $\mathrm{NGO}=$ Nongovernmental organization
() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Includes users of injectables, who are not shown separately.

## Table 25 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the five years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, and the percentage who were informed about other methods they could use, by method and initial source of method, Uttarakhand, 2005-06

| Method/source | Percentage who were informed about side effects or problems of method used | Percentage who were informed about what to do if experienced side effects | Percentage who were informed by a health or family planning worker about other methods that could be used | Number of women |
| :---: | :---: | :---: | :---: | :---: |
| Method |  |  |  |  |
| Female sterilization ${ }^{1}$ | 34.2 | 25.3 | 17.4 | 203 |
| Pill | 37.6 | 28.8 | 41.2 | 55 |
| Initial source of method ${ }^{2}$ |  |  |  |  |
| Public medical sector | 34.0 | 26.4 | 18.6 | 210 |
| Private medical sector | 44.5 | 34.1 | 42.0 | 63 |
| Total | 37.1 | 28.6 | 24.9 | 279 |

Note: Table includes only the contraceptive methods separately shown and excludes users who obtained their method from friends/relatives. Total includes IUD users and women who reported the initial source of the method as a nongovernmental organization or other sources, who are not shown separately.
${ }^{1}$ Among women who were sterilized in the five years preceding the survey.
${ }^{2}$ Source at start of current episode of use.

## Table 26 First-year contraceptive discontinuation rates

Percentage of contraceptive users who discontinued use of a method within 12 months after beginning its use, by reason for discontinuation and percentage who switched to another method, by type of method, Uttarakhand, 2005-06

| Method | Method failure | Desire to become pregnant | Side effects/ health concerns | Infrequent sex/ husband away | Marital dissolution/ separation | Other reason | Total | Switched to another method ${ }^{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Female sterilization | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Pill | 2.4 | 8.1 | 22.7 | 8.5 | 0.0 | 3.1 | 44.8 | 11.7 |
| Condom/Nirodh | 1.8 | 17.8 | 2.2 | 6.4 | 0.3 | 5.1 | 33.6 | 4.1 |
| All modern spacing methods ${ }^{2}$ | 2.0 | 14.1 | 8.4 | 7.1 | 0.2 | 4.5 | 36.3 | 6.8 |
| All spacing methods ${ }^{3}$ | 2.2 | 14.2 | 7.3 | 7.3 | 0.2 | 5.3 | 36.5 | 6.9 |
| All methods | 1.7 | 10.9 | 5.6 | 5.6 | 0.1 | 4.1 | 28.1 | 5.3 |

[^2]
## Table 27 Men's contraception-related perceptions and knowledge

Percentage of men age 15-49 who agree with two specific statements about women and contraception and say that a woman who is breastfeeding cannot become pregnant, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Uttarakhand, 2005-06

| Background characteristic | Percentage of men who agree |  |  | Percentage of men who say that if a male condom is used correctly, it protects against pregnancy: |  |  |  |  | Number of men |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Contraception is women's business and a man should not have to worry about it | Women who use contraception may become promiscuous | ```A woman who is breastfeeding cannot become pregnant``` |  |  |  |  |  |  |
|  |  |  |  | Most of the time | Sometimes | Not at all | Don't know/unsure ${ }^{1}$ | Total |  |

| Fourth | 3.8 | 6.5 | 10.3 | 5.8 | 54.8 | 60.6 | 9.5 | 61.3 | 70.9 | 85.4 | 508 |
| Highest | 3.4 | 5.4 | 8.8 | 10.0 | 58.5 | 68.4 | 13.4 | 63.9 | 77.2 | 88.6 | 718 |
| Total | 4.4 | 6.5 | 10.8 | 5.6 | 53.7 | 59.3 | 10.0 | 60.1 | 70.1 | 84.6 | 2,078 |

Note: Total includes women belonging to other religions and with missing information on religion and caste/tribe, who are not shown separately.
${ }^{1}$ Unmet need for spacing includes pregnant women whose pregnancy was mistimed; amenorrhoeic women who are not using family planning and whose last birth was mistimed, or whose last birth was unwanted but now say they want more children; and fecund women who are neither pregnant nor amenorrhoeic, who are not using any method of family planning, and say they want to wait 2 or more years for their next birth. Also included in unmet need for spacing are fecund women who are not using any method of family planning and say they are unsure whether they want another child or who want another child but are unsure when to have the birth.
Unmet need for limiting refers to pregnant women whose pregnancy was unwanted; amenorrhoeic women who are not using family planning, whose last child was unwanted, and who do not want any more children; and fecund women who are neither pregnant nor amenorrhoeic, who are not using any method of family planning, and who want no more children. Excluded from the unmet need category are pregnant and amenorrhoeic women who became pregnant while using a method (these women are in need of a better method of contraception).
${ }^{2}$ Using for spacing is defined as women who are using some method of family planning and say they want to have another child or are undecided whether to have another. Using for limiting is defined as women who are using and who want no more children. Note that the specific methods used are not taken into account here.
${ }^{3}$ Nonusers who are pregnant or amenorrhoeic whose pregnancy was the result of a contraceptive failure are not included in the category of unmet need, but are included in total demand for contraception (since they would have been using had their method not failed).

Table 29 Age at first marriage
Percentage of women and men age 15-49 who were first married by specific exact ages, percentage never married, and median age at first marriage, first cohabitation with spouse, and first sex, according to current age, Uttarakhand, 2005-06

| Current age | Percentage first married by exact age: |  |  |  |  | Percentage never married | Number of respondents | Median age at first marriage | Median age at first cohabitation | Median age at first sexual intercourse |

NGO = Nongovernmental organization
na $=$ Not applicable
( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, or other health personnel.
${ }^{2}$ Based on the last live birth in the five years preceding the survey.
${ }^{3}$ Postnatal check-ups are checks on the woman's health within 42 days of the birth.

Table 39 Trends in maternal care indicators
Maternal care indicators for births during the three years preceding the survey, by residence, NFHS-3 and NFHS-2, Uttarakhand

| Indicator | NFHS-3 | NFHS-2 |
| :---: | :---: | :---: |
| URBAN |  |  |
| Percentage who received antenatal care ${ }^{1}$ | 92.4 | 81.5 |
| Percentage who had at least three antenatal care visits ${ }^{1}$ | 71.5 | 50.7 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 65.7 | 63.9 |
| Percentage of births delivered in a health facility ${ }^{2}$ | 59.9 | 41.9 |
| Percentage of deliveries assisted by health personnel ${ }^{2,3}$ | 64.6 | 54.5 |
| RURAL |  |  |
| Percentage who received antenatal care ${ }^{1}$ | 69.2 | 36.4 |
| Percentage who had at least three antenatal care visits ${ }^{1}$ | 36.2 | 11.9 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 35.2 | 14.6 |
| Percentage of births delivered in a health facility ${ }^{2}$ | 28.8 | 15.6 |
| Percentage of deliveries assisted by health personnel ${ }^{2,3}$ | 34.6 | 29.9 |
| TOTAL |  |  |
| Percentage who received antenatal care ${ }^{1}$ | 74.8 | 45.5 |
| Percentage who had at least three antenatal care visits ${ }^{1}$ | 44.8 | 19.7 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 42.6 | 24.5 |
| Percentage of births delivered in a health facility ${ }^{2}$ | 36.1 | 20.8 |
| Percentage of deliveries assisted by health personnel ${ }^{2,3}$ | 41.6 | 34.7 |

${ }^{1}$ Based on the last birth to ever-married women in the three years preceding the survey.
${ }^{2}$ Based on the last two births to ever-married women in the three years preceding the survey.
${ }^{3}$ Doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, or other health personnel.

## Table 40 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present during at least one antenatal care visit, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Uttarakhand, 2005-06

| Antenatal/delivery care and information | Urban | Rural | Total |
| :---: | :---: | :---: | :---: |
| Percentage of men for whom the youngest child's mother received antenatal care | 84.9 | 57.0 | 65.8 |
| Percentage of men who were present at any antenatal care visit | 75.5 | 45.6 | 55.0 |
| Percentage who were told by a health provider or health worker about the following signs of pregnancy complications: |  |  |  |
| Vaginal bleeding | 24.5 | 15.8 | 18.5 |
| Convulsion | 18.9 | 15.8 | 16.8 |
| Prolonged labour | 26.4 | 16.7 | 19.7 |
| Percentage ever told what to do if mother had any pregnancy complication | 34.0 | 28.1 | 29.9 |
| Percentage whose youngest child was delivered in a health facility | 58.5 | 28.1 | 37.6 |
| Percentage to whom a health provider or worker spoke about the following aspects of maternal care: |  |  |  |
| The importance of delivering in a health facility | 41.5 | 28.9 | 32.9 |
| The importance of proper nutrition for the mother during pregnancy | 45.3 | 30.7 | 35.3 |
| Family planning or delaying his next child | 35.8 | 28.1 | 30.5 |
| Number of men with a child age 0-35 months | 52 | 115 | 167 |
| Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of: |  |  |  |
| Breastfeeding the baby immediately after birth | * | 29.3 | 33.6 |
| Keeping the baby warm immediately after birth | * | 23.2 | 27.8 |
| Cleanliness at the time of delivery | * | 42.7 | 45.2 |
| Using a new or unused blade to cut the cord | * | 48.8 | 50.9 |
| Number of men whose last child age 0-35 months was not delivered in a health institution | 22 | 82 | 104 |
| * Percentage not shown; based on fewer than 25 unweighted cases. |  |  |  |

## Table 41 Vaccinations by background characteristics

Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), and percentage with a vaccination card seen by the interviewer, by background characteristics, Uttarakhand, 2005-06, and total for NFHS-2

| Background characteristic | BCG | DPT |  |  | Polio ${ }^{1}$ |  |  |  | Measles | All basic vaccinations ${ }^{2}$ | $\begin{gathered} \text { No } \\ \text { vaccina- } \end{gathered}$tions | Percentage with a vaccination card seen | $\begin{gathered} \text { Number } \\ \text { of } \\ \text { children } \end{gathered}$ |

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation units (SD) from the median of the 2006 WHO International Reference Population. Table is based on children with valid dates of birth (month and year) and valid measurements of both height and weight. Total includes children belonging to other religions and with missing information on religion, size at birth, and mother's nutritional status, who are not shown separately.
BMI $=$ Body mass index $\left(\mathrm{kg} / \mathrm{m}^{2}\right)$
na $=$ Not available
() Based on 25-49 unweighted cases

* Not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Includes children who are below -3 standard deviations (SD) from the International Reference Population median.
${ }^{2}$ Excludes children whose mothers were not interviewed.
${ }^{3}$ First born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval.
${ }^{4}$ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
${ }^{5}$ Includes children whose mothers are deceased.

Table 49 Initial breastfeeding
Percentage of children born in the five years preceding the survey who were ever breastfed, and for last-born children born in the five years preceding the survey who were ever breastfed, percentage who started breastfeeding within half an hour, one hour, and one day of birth and percentage who received a prelacteal feed, by background characteristics, Uttarakhand, 2005-06

| 4-5 | 6.2 | 10.1 | 19.7 | 3.9 | 42.0 | 18.1 | 100.0 | 50 | 39.9 | 50 |
| 6-8 | 4.3 | 7.2 | 15.6 | 7.1 | 18.0 | 47.7 | 100.0 | 72 | 33.3 | 72 |
| 9-11 | 12.6 | 2.7 | 6.7 | 2.7 | 9.4 | 66.0 | 100.0 | 77 | 33.6 | 77 |
| 12-17 | 19.1 | 2.1 | 3.2 | 1.1 | 2.0 | 72.5 | 100.0 | 97 | 32.7 | 103 |
| 18-23 | 23.8 | 2.0 | 0.9 | 0.0 | 1.0 | 72.4 | 100.0 | 106 | 35.4 | 116 |
| 24-35 | 43.4 | 1.3 | 0.0 | 0.0 | 0.0 | 55.3 | 100.0 | 158 | 31.3 | 230 |
| <4 | 4.3 | 46.1 | 25.4 | 2.7 | 15.8 | 5.6 | 100.0 | 71 | 22.1 | 73 |
| <6 | 5.1 | 31.2 | 23.1 | 3.2 | 26.6 | 10.8 | 100.0 | 122 | 29.3 | 124 |
| 6-9 | 5.4 | 6.8 | 14.6 | 5.6 | 15.3 | 52.2 | 100.0 | 91 | 31.7 | 92 |
| 12-23 | 21.5 | 2.0 | 2.0 | 0.5 | 1.5 | 72.5 | 100.0 | 203 | 34.1 | 219 |

Note: Breastfeeding status refers to a '24-hour' period (yesterday and last night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water only, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus any children who get complementary food are classified in that category as long as they are breastfeeding as well. Children who receive breast milk and non-milk liquids and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water.
() Based on 25-49 unweighted cases.
${ }^{1}$ Based on all children under three years.

> Note: Table includes children belonging to other religions, who are not shown separately. na = Not applicable

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ It is assumed that children not currently living with the mother are not currently breastreeding.
${ }^{3}$ Food groups are: a. infant formula, milk other than breast milk, cheese or yogurt or other milk products; b. foods made from grains or roots, including porridge or gruel, fortified baby food; c. vitamin A-rich fruits and vegetables; d. other fruits and vegetables; e. eggs; f. meat, poultry, fish, shellfish, or organ meats; g. beans, peas, lentils, or nuts; h. foods made with oil, fat, ghee, or butter.
${ }^{4}$ At least twice a day for breastfed infants 6-8 months and at least three times a day for breastfed children 9-23 months.
${ }^{6}$ Three or more food groups for breastfed children and four or more food groups for non-breastfed children.
${ }^{6}$ Three or more food groups for breastfed children and four or more food groups for non-breastfed children.
7 Fed solid or semi-solid food at least twice a day for infants $6-8$ months, 3 or more times for other breastfed
${ }^{8}$ Non-breastfed children age 6-23 months are considered to be fed with three IYCF practices if they receive milk or milk products and are fed at least the minimum number of times per day with at least the minimum number of food groups.

| ${ }^{1}$ Sexual intercourse with a partner who was neither a spouse nor who l ${ }^{2}$ Injections given by a doctor, nurse, pharmacist, dentist, or other health | ed with the worker. |  |  | ${ }^{1}$ Sexual intercourse with a partner who was neither a spouse nor who lived with the respondent. |  |  |

## Table 61 Knowledge of AIDS and sexual behaviour: Youth

Indicators of HIV/AIDS knowledge and sexual behaviour for women and men age 15-24, by residence, Uttarakhand, 2005-06

| Knowledge and Behaviour | Urban |  | Rural |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Women | Men | Women | Men | Women | Men |
| Knowledge |  |  |  |  |  |  |
| Percentage with comprehensive knowledge of AIDS ${ }^{1}$ | 45.6 | 41.1 | 29.2 | 52.6 | 33.4 | 48.6 |
| Percentage who know a condom source | 57.6 | 94.6 | 47.4 | 89.5 | 50.0 | 91.3 |
| Sexual behaviour |  |  |  |  |  |  |
| Percentage who have ever had sexual intercourse | 20.3 | 19.6 | 40.0 | 20.6 | 34.9 | 20.3 |
| Percentage who had sexual intercourse before age 15 | 1.9 | 1.8 | 3.0 | 0.5 | 2.8 | 0.9 |
| HIV testing, injections, and blood transfusion |  |  |  |  |  |  |
| Percentage who have ever had a blood transfusion | 3.2 | 0.0 | 1.7 | 2.9 | 2.1 | 1.9 |
| Percentage who received an injection from a health worker in the past 12 months ${ }^{2}$ | 24.1 | 20.5 | 26.9 | 22.5 | 26.2 | 21.8 |
| Mean number of medical injections in the past 12 months ${ }^{2}$ | 1.0 | 0.7 | 1.0 | 1.0 | 1.0 | 0.9 |
| Number of respondents age 15-24 | 291 | 111 | 849 | 210 | 1,140 | 321 |
| Among those who received an injection from a health worker in the past 12 months, percentage for whom for the last injection, the syringe and needle were taken from a newly opened package or the needle was sterilized ${ }^{2}$ | 90.8 | * | 85.1 | (93.6) | 86.4 | 92.9 |
| Number of respondents who received an injection from a health worker in the past 12 months ${ }^{2}$ | 70 | 23 | 229 | 47 | 299 | 70 |
| Percentage who used a condom at first sexual intercourse | 15.6 | * | 4.9 | (14.0) | 6.5 | 13.8 |
| Number who ever had sexual intercourse | 59 | 22 | 339 | 43 | 398 | 65 |
| Percentage tested for HIV and received results in the past 12 months | 3.1 | * | 1.6 | (5.6) | 1.8 | 5.5 |
| Percentage who had higher-risk intercourse ${ }^{3}$ in the past 12 months | 0.0 | * | 0.0 | (22.2) | 0.0 | 34.4 |
| Number who had sexual intercourse in the past 12 months | 59 | 19 | 333 | 36 | 392 | 55 |
| Percentage who reported using a condom at last higher-risk intercourse ${ }^{3}$ | nc | * | nc | * | nc | * |
| Number who had higher-risk sexual intercourse ${ }^{3}$ in the past 12 months | 0 | 11 | 0 | 8 | 0 | 19 |
| Among those never married |  |  |  |  |  |  |
| Percentage who have never had sexual intercourse | 100.0 | 86.5 | 100.0 | 92.2 | 100.0 | 90.2 |
| Percentage who had sexual intercourse in the past 12 months | 0.0 | 10.6 | 0.0 | 4.4 | 0.0 | 6.7 |
| Number of never married respondents age 15-24 | 231 | 103 | 509 | 181 | 740 | 284 |

$\mathrm{nc}=$ Not calculated because there are no cases
( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Respondents with comprehensive knowledge say that use of a condom for every act of sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV/AIDS, say that a healthy-looking person can have HIV/AIDS, and reject the two most common misconceptions in NFHS-3, namely that HIV/AIDS can be transmitted by mosquito bites and by sharing food
${ }^{2}$ Injection given by a doctor, nurse, pharmacist, dentist, or other health worker.
${ }^{3}$ Sexual intercourse with a partner who was neither a spouse nor lived with the respondent.

| Table 62 Attitudes toward family life education in school |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Percentage of women and men age 15-49 who agree that specific topics on family life education should be taught in school to girls and to boys, and percent distribution of those who agree that a specific topic should be taught in school by the age at which they believe that the topic should first be taught in school, Uttarakhand, 2005-06 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Number who experienced physical violence | 458 | 61 | 520 |
| Person committing sexual violence |  |  |  |
| Current husband | 07.5 | $n c$ | 87.5 |
| Former husband | 5.2 | $n c$ | 5.2 |
| Other relative | 2.1 | $n c$ | 2.1 |
| In-law | 0.7 | $n c$ | 0.7 |
| Own friend/acquaintance | 0.7 | $n c$ | 0.7 |
| Family friend | 2.2 | $n c$ | 2.2 |
| Other | 0.7 | $n c$ | 0.7 |
| Number who experienced sexual violence | 92 | 0 | 92 |
|  |  |  |  |

Note: All women were asked about their experience of physical violence since age 15. Evermarried women were also asked about their experience of spousal physical violence at any age. Total includes women with missing information about person committing sexual violence, who are not shown separately.
$\mathrm{nc}=$ Not calculated because there are no cases
() Based on 25-49 unweighted cases.

Table 76 Forms of spousal violence
Percentage of ever-married women age 15-49 who have experienced various forms of violence committed by their husband ever or in the 12 months preceding the survey, Uttarakhand, 2005-06

| Type of violence | Ever | In the past 12 months ${ }^{1}$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Often | Sometimes | Often or sometimes |
| Physical violence |  |  |  |  |
| Any form of physical violence | 27.3 | 3.7 | 12.3 | 15.9 |
| Pushed her, shook her, or threw something at her | 11.6 | 1.4 | 7.2 | 8.6 |
| Slapped her | 26.1 | 3.2 | 11.3 | 14.4 |
| Twisted her arm or pulled her hair | 13.9 | 1.6 | 7.1 | 8.7 |
| Punched her with his fist or with something that could hurt her | 7.0 | 1.2 | 3.7 | 4.9 |
| Kicked her, dragged her, or beat her up | 6.9 | 0.9 | 4.0 | 4.9 |
| Tried to choke her or burn her on purpose | 3.1 | 0.7 | 1.3 | 2.0 |
| Threatened her or attacked her with a knife, gun, or any other weapon | 1.2 | 0.4 | 0.4 | 0.8 |
| Sexual violence |  |  |  |  |
| Any form of sexual violence | 6.1 | 1.8 | 2.9 | 4.7 |
| Physically forced her to have sexual intercourse with him even when she did not want to | 5.6 | 1.6 | 2.8 | 4.4 |
| Forced her to perform any sexual acts she did not want to | 2.8 | 0.9 | 1.3 | 2.2 |
| Emotional violence |  |  |  |  |
| Any form of emotional violence | 8.9 | 2.6 | 3.8 | 6.4 |
| Said or did something to humiliate her in front of others | 7.2 | 2.0 | 3.0 | 5.0 |
| Threatened to hurt or harm her or someone close to her | 3.5 | 0.9 | 1.3 | 2.3 |
| Insulted her or made her feel bad about herself | 5.5 | 1.6 | 2.6 | 4.2 |
| Any form of physical and/or sexual violence | 27.8 | 4.5 | 12.6 | 17.0 |
| Any form of physical and sexual violence | 5.6 | 1.8 | 2.7 | 4.6 |
| Any form of physical and/or sexual and/or emotional violence | 29.8 | 5.3 | 13.5 | 18.9 |
| Any form of physical and sexual and emotional violence | 2.6 | 1.3 | 0.9 | 2.2 |
| Any violence by women against their husband ${ }^{2}$ | 0.6 | 0.0 | 0.4 | 0.5 |
| Number of ever-married women | 1,438 | 1,385 | 1,385 | 1,385 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.
${ }^{1}$ Excludes widows.
${ }^{2}$ Any violence by women against their husband when he was not already beating or physically hurting her.

| 3-4 | 7.1 | 25.0 | 5.0 | 25.8 | 27.0 | 686 |
| Number of reasons for which wife beating is justified ${ }^{4}$ |  |  |  |  |  |  |
| 0 | 6.5 | 20.2 | 4.3 | 20.6 | 22.2 | 694 |
| 1-2 | 9.3 | 24.4 | 6.8 | 25.8 | 28.0 | 255 |
| 3-4 | 12.2 | 34.7 | 11.9 | 35.4 | 38.2 | 195 |
| 5-6 | 10.0 | 42.0 | 4.1 | 42.0 | 43.1 | 193 |
| 7 | 16.2 | 41.2 | 9.5 | 41.2 | 44.5 | 100 |
| Number of reasons given for refusing to have sexual intercourse with husband ${ }^{5}$ |  |  |  |  |  |  |
| 0 | 13.5 | 31.5 | 5.1 | 31.5 | 36.1 | 91 |
| 1-2 | 13.0 | 33.2 | 9.7 | 33.2 | 36.5 | 224 |
| 3 | 7.7 | 25.8 | 5.5 | 26.4 | 27.9 | 1,123 |
| Total | 8.9 | 27.3 | 6.1 | 27.8 | 29.8 | 1,438 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women with missing information on husband's education, husband's alcohol consumption, spousal age difference, and spousal education difference, who are not shown separately.
() Based on 25-49 unweighted cases.
${ }^{1}$ Currently married women only.
${ }^{2}$ Behaviours include: he is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money.
${ }^{3}$ Currently married women only. Decisions included are decisions about own health care, major household purchases, purchases for daily household needs, and visits to her family or relatives.
${ }^{4}$ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook food properly, he suspects she is unfaithful, and she shows disrespect for in-laws.
${ }^{5}$ Reasons given for refusing to have sexual intercourse with husband include: she knows husband has a sexually transmitted disease, she knows husband has sex with other women, and she is tired or not in the mood.

Table 79 Injuries to women due to spousal violence
Percentage of ever-married women age 15-49 who have experienced specific types of spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Uttarakhand, 2005-06

| Type of spousal violence experienced | Percentage of women who have had: |  |  |  |  | Number of ever-married women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Cuts, bruises, or aches | Severe burns | Eye injuries, sprains, dislocations, or burns | Deep wounds, broken bones, broken teeth, or any other serious injury | Any of these injuries |  |
| Experienced physical violence |  |  |  |  |  |  |
| Ever | 36.6 | 2.0 | 12.3 | 8.2 | 37.8 | 392 |
| In the past 12 months ${ }^{1}$ | 42.6 | 2.6 | 16.3 | 11.9 | 44.3 | 221 |
| Experienced sexual violence |  |  |  |  |  |  |
| Ever | 60.3 | 8.2 | 22.3 | 20.9 | 60.3 | 87 |
| In the past 12 months ${ }^{1}$ | 61.6 | 6.8 | 22.5 | 20.6 | 61.6 | 65 |
| Experienced physical or sexual violence |  |  |  |  |  |  |
| Ever | 35.9 | 1.9 | 12.0 | 8.1 | 37.1 | 400 |
| In the past 12 months ${ }^{1}$ | 40.8 | 2.5 | 15.5 | 11.1 | 42.4 | 236 |
| Experienced physical and sexual violence |  |  |  |  |  |  |
| Ever | 66.0 | 9.0 | 24.4 | 22.8 | 66.0 | 79 |
| In the past 12 months ${ }^{1}$ | 75.9 | 8.8 | 27.9 | 26.8 | 75.9 | 50 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.
${ }^{1}$ Excludes widows.

Table 80 Help seeking behaviour
Percentage of women age 15-49 who have ever experienced physical or sexual violence by whether they have ever sought help, and among those who have sought help from any source, the source from which help was sought, according to the type of violence experienced and marital status, Uttarakhand, 2005-06

| Source | Type of violence experienced |  |  | Marital status |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Physical only | Sexual only | Both physical and sexual | $\begin{gathered} \text { Ever } \\ \text { married } \end{gathered}$ | Never married |  |
| Help seeking behaviour |  |  |  |  |  |  |
| Never sought help and never told anyone | 71.7 | * | 50.4 | 69.2 | (60.6) | 68.2 |
| Never sought help but told someone | 2.6 | * | 5.6 | 3.2 | (2.2) | 3.1 |
| Sought help | 15.8 | * | 32.4 | 18.0 | (20.6) | 18.3 |
| Don't know/missing | 9.9 | * | 11.6 | 9.6 | (16.6) | 10.4 |
| Number of women who experienced violence | 437 | 9 | 83 | 467 | 61 | 529 |
| Sources of help among those who sought any help |  |  |  |  |  |  |
| Own family | 66.0 | * | (64.7) | 61.6 | * | 65.2 |
| Husband's family | 28.8 | * | (38.1) | 36.7 | * | 31.9 |
| Husband/last husband | 1.0 | * | (5.1) | 2.5 | * | 2.1 |
| Friend | 13.5 | * | (2.6) | 6.6 | * | 10.3 |
| Neighbour | 0.9 | * | (7.7) | 4.0 | * | 3.5 |
| Religious leader | 1.0 | * | (2.3) | 1.6 | * | 1.4 |
| Doctor/medical personnel | 0.0 | * | (2.6) | 0.8 | * | 0.7 |
| Police | 2.0 | * | (7.2) | 3.9 | * | 3.4 |
| Lawyer | 0.0 | * | (10.0) | 3.2 | * | 2.8 |
| Other | 0.0 | * | (2.6) | 0.8 | * | 0.7 |
| Number of women who sought help | 69 | 1 | 27 | 84 | 13 | 97 |

( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.

## APPENDIX

## ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) nonsampling errors, and (2) sampling errors. Nonsampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the third National Family Health Survey (NFHS-3) to minimize this type of error, nonsampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-3 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS3 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-3 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any percentage or average as a ratio estimate, $r=y / x$, where $y$ represents the total sample value for variable $y$, and $x$ represents the total number of cases in the group or subgroup under consideration. The variance of $r$ is computed using the formula given below, with the standard error being the square root of the variance:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1-f}{x^{2}} \sum_{h=1}^{H}\left[\frac{m_{h}}{m_{h}-1}\left(\sum_{i=1}^{m_{h}} z_{h i}^{2}-\frac{z_{h}^{2}}{m_{h}}\right)\right]
$$

in which

$$
z_{h i}=y_{h i}-r x_{h i}, \text { and } z_{h}=y_{h}-r x_{h}
$$

where $h$ represents the stratum, which varies from 1 to $H$,
$m_{h}$ is the total number of clusters selected in the $h^{\text {th }}$ stratum,
$y_{h i} \quad$ is the sum of the weighted values of variable $y$ in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum,
$x_{h i} \quad$ is the sum of the weighted number of cases in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum, and
$f \quad$ is the overall sampling fraction, which is so small that it is ignored.
The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-3 sample for Uttarakhand, there were 98 clusters. Hence, 98 replications were created. The variance of a rate $r$ is calculated as follows:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1}{k(k-1)} \sum_{i=1}^{k}\left(r_{i}-r\right)^{2}
$$

in which

$$
r_{i}=k r-(k-1) r_{(i)}
$$

where $r$ is the estimate computed from the full sample of 98 clusters,
$r_{(i)}$ is the estimate computed from the reduced sample of 97 clusters ( $i^{\text {th }}$ cluster excluded), and
$k \quad$ is the total number of clusters.
In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ) for each estimate are also computed.

Sampling errors for NFHS-3 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Uttarakhand as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A. 2 presents the value of the statistic (R), its standard error (SE), the number of unweighted ( N ) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ); for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1 ). In the case of the total fertility rate, the number of unweighted cases is not relevant, as there is no known unweighted value for woman-years of exposure to childbearing.

## Table A. 1 List of variables for sampling errors, Uttarakhand, 2005-06

| Variable | Estimate | Base population |
| :---: | :---: | :---: |
| Sex ratio (females per 1,000 males) | Ratio | De facto household population, all ages |
| No education | Proportion | De facto household population of females/males age 6 and above |
| Tuberculosis prevalence | Rate | 100,000 usual household residents |
| Using adequately iodized salt | Proportion | Households |
| Urban residence | Proportion | Women/men age 15-49 |
| No education | Proportion | Women/men age 15-49 |
| Completed 10 or more years of education | Proportion | Women/men age 15-49 |
| Never married, including married gauna not performed | Proportion | Women/men age 15-49 |
| Currently married | Proportion | Women/men age 15-49 |
| Married before age 18 | Proportion | Women age 20-49 |
| Married before age 21 | Proportion | Men age 25-49 |
| Currently using any method | Proportion | Currently married women age 15-49 |
| Currently using a modern method | Proportion | Currently married women age 15-49 |
| Currently using a traditional method | Proportion | Currently married women age 15-49 |
| Currently using female sterilization | Proportion | Currently married women age 15-49 |
| Currently using pill | Proportion | Currently married women age 15-49 |
| Currently using IUD | Proportion | Currently married women age 15-49 |
| Currently using condom | Proportion | Currently married women age 15-49 |
| Using public medical sector source of contraception | Proportion | Women age 15-49 currently using modern methods of contraception |
| Want no more children | Proportion | Currently married women/men age 15-49 |
| Want to delay next birth at least 2 years | Proportion | Currently married women/men age 15-49 |
| Ideal number of children | Mean | Women/men age 15-49 |
| Mother received ANC from health personnel | Proportion | Women with at least one birth in last five years (last birth) |
| Took iron and folic acid (IFA) for 90 days or more | Proportion | Women with at least one birth in last five years (last birth) |
| Births delivered by a skilled provider | Proportion | Births in last 5 years |
| Institutional delivery | Proportion | Births in last 5 years |
| Postnatal check for mother within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Treated with ORS packets | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Children with diarrhoea taken to a health provider | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Child's vaccination card seen by interviewer | Proportion | Children age 12-23 months |
| Child received BCG vaccination | Proportion | Children age 12-23 months |
| Child received DPT vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received polio vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received measles vaccination | Proportion | Children age 12-23 months |
| Child fully vaccinated | Proportion | Children age 12-23 months |
| Children given vitamin A supplement in last 6 months | Proportion | Children age 6-59 months |
| Ever experienced physical or sexual violence | Proportion | Women age 15-49 |
| Weight-for-height, wasting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Height-for-age, stunting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-age, underweight (below -2SD) | Proportion | Children under age 5 years who were measured |
| Body mass index (BMI) $<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women/men age 15-49 who were measured |
| Body mass index (BMI) $\geq 25.0 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women/men age 15-49 who were measured |
| Have heard of AIDS | Proportion | Women/men age 15-49 |
| Have comprehensive knowledge about HIV/AIDS | Proportion | Women/men age 15-49 |
| Total and age-specific fertility rates (last 3 years) | Rate | Women |
| Mortality rates | Rate | Births in last 5 years |
| Women/men with any anaemia | Proportion | Women/men age 15-49 |
| Children with any anaemia | Proportion | Children age 6-59 months |

| Residence | Value(R) | Standard error (SE) | Number of cases |  | Design effect (DEFT) | Relative standard error (SE/R) | Confidence limits |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Unweighted | Weighted |  |  |  |  |
|  |  |  | ( N ) | ( WN ) |  |  | R-2SE | R+2SE |
| Sex ratio (females per 1,000 males, all ages) |  |  |  |  |  |  |  |  |
