## InTRODUCTION

The 2005-06 National Family Health Survey (NFHS-3) is the third in the NFHS series of surveys. The first NFHS was conducted in 1992-93, and the second (NFHS-2) was conducted in 1998-99. All three NFHS surveys were conducted under the stewardship of the Ministry of Health and Family Welfare (MOHFW), Government of India. The MOHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-3 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation, UNICEF, UNFPA, and the Government of India. Technical assistance for NFHS-3 was provided by Macro International, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute, Pune (NARI).

In Manipur, NFHS-3 interviewed 4,512 women age 15-49 and 3,951 men age 15-54 to obtain information on population, health, and nutrition in the state. The survey is based on a sample of 3,498 households that is representative at the state level, and within the state, at the urban and rural levels. The household response rate in the state as a whole was 98.7 percent and the individual response rates were 94.7 percent for eligible women and 88.4 percent for eligible men.

The survey provides trend data on key indicators and includes information on several new topics, such as HIV/AIDS-related behaviours, attitudes towards family life education for girls and boys, use of the Integrated Child Development Services (ICDS) programme, men's involvement in maternal care, and health insurance. For the first time, NFHS-3 provides information on men and unmarried women. In addition, HIV prevalence is measured at the national level and for selected states, including Manipur.

In Manipur, height and weight measurements were taken for all children under age six years and all interviewed women and men in all the sample households. Haemoglobin levels were measured for all interviewed women and men and for all children age 6-59 months. In addition, all interviewed women and men in all sample households were eligible to have their blood collected for HIV testing. All biomarkers were measured only after obtaining informed consent. The NFHS-3 fieldwork in Manipur was conducted by TNS India Pvt. Ltd., New Delhi, between May 2006 and August 2006.

This report presents the key findings of the NFHS-3 survey in Manipur, followed by detailed tables and appendices that provide sampling errors and information on the coverage of HIV testing. More information about the definitions of indicators included in this report is contained in Volume I of the NFHS-3 National Report, and the questionnaires and details of the sampling procedure for NFHS-3 are contained in Volume II of the NFHS-3 National Report (available at www.nfhsindia.org).

## Household Characteristics

## Household composition

Nearly one-third of households (32\%) in Manipur are in urban areas, with over two-thirds in rural areas. On average, households in Manipur are comprised of 5 members. Less than twothirds of households ( $63 \%$ ) have a nuclear family structure, and 17 percent are headed by women.

Over half of the households have household heads that are Hindu (53\%) and more than onequarter ( $26 \%$ ) have household heads who are Christian. Nine percent of households have a Muslim household head.

Twenty-six percent of household heads belong to a scheduled tribe, 7 percent belong to a scheduled caste, and 12 percent belong to other backward classes. More than half of the households ( $56 \%$ ) do not belong to the scheduled castes, scheduled tribes, or other backward classes.

One-third of the population of Manipur is under the age of 15 years; 8 percent is age 60 and over, including 5 percent that is age 65 and over. Among children under 18 years of age, 5 percent have experienced the death of one or both parents, about the same as in the nation as a whole. In all, 83 percent of children under 18 years of age live with both parents, and 13 percent live with one parent.

## Housing characteristics

Only 11 percent of households live in a pисса house. Eighty-seven percent of households ( $84 \%$ of rural households and $93 \%$ of urban households) have electricity, up from 75 percent at the time of NFHS-2. Only 4 percent of households have no toilet facilities, down from 8 percent at the time of NFHS-2. However, less than one in three ( $30 \%$ ) have an improved toilet that is not shared. The proportion of households with no toilet facility is about 6 percent in rural areas and less than one percent in urban areas.

In Manipur, one-third of households get their drinking water from a tap and only 4 percent have no toilet facility.

Fifty-two percent of households use an improved source of drinking water ( $60 \%$ of urban households and $48 \%$ of rural households) but only 12 percent ( $27 \%$ urban and $5 \%$ rural) have drinking water piped into their dwelling, yard, or plot. In addition, 21 percent of households get their drinking water from a public tap or standpipe. Eighty-five percent of households treat their drinking water to make it potable: two-thirds boil the water ( $67 \%$ ), 15 percent use a water filter, and the remaining, strain the water through a cloth or treat it in some other way.

## Wealth Index

The wealth index is constructed by combining information on 33 household assets and housing characteristics such as ownership of consumer items, type of dwelling, source of water, and availability of electricity, into a single wealth index. The household population is divided into five equal groups of 20 percent each (quintiles) at the national level from 1 (lowest, poorest) to 5 (highest, wealthiest). Since the quintiles of the wealth index are defined at the national level, the proportion of the population of a particular state that falls in any specific quintile will vary across states.

Wealth Index
Percentage of households in urban and rural areas and percent distribution of households by wealth quintile

In Manipur, 15 percent of households ( $30 \%$ of the urban and $8 \%$ of the rural households) are in the highest wealth household quintile. Large proportion of the population of Manipur is in the third and fourth wealth quintiles ( $34 \%$ and $31 \%$, respectively) and a much lower proportion is in the lowest wealth quintile (3\%). This comparison based on the wealth index suggests that the population of Manipur is, on average, wealthier than the population in the nation as a whole.

## EdUCATION

## Current school attendance among children

Nearly four-fifths of children (79\%) age 6-17 years attend school; and this percentage is 9 percentage points higher in the urban than in the rural areas. Eighty-three percent of primary-school age children (6-10 years) attend school ( $90 \%$ in urban areas and $80 \%$ in rural areas). School attendance increases to 88 percent for children age 11-14 years, but then drops to 58 percent for children age 15-17 years.

Gender disparity in education is evident in the school age population in Manipur where 77 percent of girls age 6-17 years attend school, compared with 81 percent of

Are there gender differentials in children's current school attendance?
Percentage of children attending school by age

boys in the same age group. However, the extent and direction of this gender disparity varies greatly by age and urban-rural residence. Among children age 6-10 years, there is little gender disparity in school attendance in urban and in rural areas. Among the population age 11-14 years, the gender disparity in school attendance is still small in urban areas, but in rural areas, school attendance among boys is 6 percentage points higher than for girls. By age 15-17 years, gender disparity in school attendance in favour of boys is evident in both urban and rural areas, although the disparity is much greater in rural areas. In rural areas, 62 percent of boys, compared with only 49 percent of girls age 15-17 attend school, whereas in urban areas, 69 percent of boys, compared with 64 percent of girls attend school.

## Literacy and educational attainment

In NFHS-3, literate persons are those who have either completed at least standard six or 'passed' a simple literacy test conducted as part of the survey. According to this measure, only 73 percent of women and 92 percent of men age 15-49 are literate in Manipur.

Twenty-two percent of women, compared with only 6 percent of men age 15-49 in Manipur, have never been to school. Thirty-two percent of men have completed 12 or more years of education, but only 21 percent of women have attained that level of education. Nonetheless, the proportion of adults age 15-49 who have completed 12 or more years of education is higher in Manipur than in any other Northeastern state; and the proportion of men who have completed at least 12 years of education is higher in Manipur than in any other state in India, except Delhi.

## Attitudes toward family life education in school

Virtually all adults in Manipur agree that children should be taught moral values in school.
The vast majority of adults think that children should learn about the changes in their own bodies during puberty; but fewer adults think that children should learn about puberty-related changes in the bodies of the opposite sex.

Men and women differ somewhat on whether they think that children should be taught in school about contraception. Over two-thirds of men think that girls and boys should learn about contraception in school, compared with 45-50 percent of women.

Over nine in ten women and men believe that information on HIV/AIDS should be part of the school curriculum. While 68 percent of men say that both boys and girls should be taught about sex and sexual behaviour in school, less than half of women ( $46 \%$ ) agree that this is an appropriate topic for school children.

Similarly, more than three-fourths of men ( $78 \%$ ), but only half of women think that condom use to avoid sexually transmitted diseases is a topic which is appropriate to be taught to boys and girls in school.

## Fertility

## Age at first marriage

In Manipur, the median age at first marriage is 22 years among women age 25-49 and is 25-27 years among men age $30-49$ years. Thirteen percent of women age $20-24$ years got married before the legal minimum age of 18 and 12 percent of men age 25-29 years got married before the legal minimum age of 21 .

## Fertility levels

At current fertility levels, a woman in Manipur will have an average of 2.8 children in her lifetime, which is above replacement level. Although fertility increased by 0.3 children between NFHS-1 and NFHS-2, in the period between NFHS-2 and NFHS-3, fertility fell back to its level in NFHS-1.

Fertility in rural areas, at 3.1 children per woman, is almost three-fourths of a child higher than in urban areas where fertility is 2.4 children per woman. Among births in the three years preceding the survey, 22 percent

## Fertility Trends

Total fertility rate (children per woman)
 were of birth order four or higher.

## Total Fertility Rate by State

Children per woman

> At 2.8 children per woman, the total fertility rate in Manipur is similar to the national average and is above the replacement level of 2.1 children per woman

Fertility in Manipur declines sharply with education and wealth. In general, the differential in fertility between women in the higher categories versus the lower categories of education and wealth is such that women in the lower education and wealth categories (no or less education or lower wealth quintile) have at least one child more than those in the higher categories (more educated/higher wealth quintile).

There are also large fertility differentials in Manipur by caste/tribe and religion. Women belonging to the scheduled tribes have at least one child more than women in other caste/tribe sub-groups. A Christian woman in Manipur has in her lifetime, 1.4 more children on average, than a Hindu woman.

## How does fertility vary with education and household wealth? Total fertility rate (children per woman)

Note: Category with fewer than 125 unweighted woman-years of exposure is not shown.

## Teenage pregnancy

Seven percent of young women age 15-19 have already begun childbearing, much lower than the national average of 16 percent. Young women in rural areas are twice as likely to have begun childbearing as young women in urban areas ( $9 \%$ and $4 \%$, respectively). Teenage pregnancy and motherhood declines sharply with education: 25 percent of women with no education have begun childbearing, compared with only 4 percent of women with 10 or more years of education.

## Birth intervals

The median interval between births in Manipur is 35 months. Twenty percent of non-first order births take place within 24 months of the previous birth, including 7 percent that take place within 18 months. More than half ( $52 \%$ ) of births occur within three years. Research shows that waiting at least three years between children reduces the risk of infant mortality.

## Fertility preferences

Sixty-three percent of currently married women and 60 percent of currently married men either want no more children, are already themselves sterilized, or have a spouse who is sterilized. Among those who do want another child, more than half would like to wait at least two years. Among the ever-married, less than two-fifths of women ( $35 \%$ ) and men $(38 \%)$ consider the ideal family size to be two children or less.

A strong son preference is evident in the fertility preferences of women and men in Manipur. Twenty-nine percent of women and

Trends in desire for no more children?
Percentage of currently married women with two children who want no more children
 35 percent of men want more sons than daughters, compared with only 4 percent of women and 3 percent of men who want more daughters than sons. However, most men and women would like to have at least one son and at least one daughter.

The desire for more children is strongly affected by women's number of sons. For example, among women with two children, those with two sons and no daughters are more than twice as likely to want no more children (69\%) than those with two daughters and no sons (32\%) (not all data shown in tables). Notably, however, the proportion of currently married women with two children who want no more children is higher in NFHS-3 than it was in NFHS-2, irrespective of women's number of sons ( $65 \%$ and $46 \%$, respectively). Unplanned pregnancies are relatively common. If all women were to have only the number of children they want, the total fertility rate would be 2.3 instead of 3.8.

## Family Planning

## Knowledge of family planning methods

Knowledge of contraception is almost universal in Manipur. Most adults know about one or more contraceptive methods. However, knowledge of some temporary methods, including injectables and female condoms, is lower than of others. The three modern temporary methods promoted by the government family planning programme, namely the pill, the IUD, and condoms, are known to nearly all (93-95\%) currently married women; the condom and pill are also known to nearly all men ( $94-99 \%$ ), but the IUD is known

How many women know about family planning?
Percentage of currently married women

to fewer men $(85 \%)$. The two common traditional methods, rhythm and withdrawal, are also known to a majority of women and men; however, withdrawal is known by a higher proportion of women and men than is the rhythm method. Notably, a higher proportion of men report knowledge of each of the different contraceptive methods than women, with the exception of the IUD.

Knowledge of sterilization among women has been high since NFHS-1, but knowledge of all temporary contraceptive methods has increased considerably since then. Among currently married women, 93 percent now know about the pill, for example, compared with only 78 percent in NFHS-1 and 82 percent in NFHS-2. Similarly, only 60 percent of women knew about the condom in NFHS-1; this proportion has risen steadily to 95 percent in NFHS-3.

## Contraceptive use

The contraceptive prevalence rate among currently married women is 49 percent, up from 39 percent in NFHS-2 and 35 percent in NFHS-1. Contraceptive use is higher in urban areas ( $55 \%$ ) than in rural areas ( $46 \%$ ) of the state.

Unlike most other states in India, the percentage of currently married women using traditional methods ( $25 \%$ ) in Manipur, is marginally higher than the percentage using any modern method ( $24 \%$ ). The most common traditional method reported is withdrawal, which is being used by 17

How many women use family planning? Percentage of currently married women

Any method
Any modern method percent of women. The next most common methods are female sterilization and the rhythm method, each used by only 8 percent of women. The next most common methods are pill and IUD, each used by 5 percent of women and condoms used by only 4 percent of women. Use of female sterilization has declined by 6 percentage points in NFHS-3 from its level in NFHS-2, when 14 percent of currently married women were using female sterilization. Use of female sterilization in NFHS-3 is also lower than it was at the time of NFHS-1.

Contraceptive use increases sharply with age peaking in the age group 30-39 (58\%) and then declines to 39 percent for women in the age group 40-49. Use also increases with education; however, the increase is very gradual from 43 percent among women with no education to 52 percent among women with 10 or more years of education. Notably, women in all education groups are more likely to use withdrawal than any one of the modern methods.

Christian women are less likely to use contraception (31\%) than women of other religions ( $43 \%$ among Muslim, $56 \%$ among Hindus, and $59 \%$ among other religious groups). Women from the lowest wealth quintile and scheduled-tribe women are less likely to use family planning methods than most other women. Women in the three higher wealth quintiles are more than three times as likely to use contraception as women in the lowest wealth quintile.

Women are more likely to use contraception if they already have a son. For example, among women with two children, 58 percent with two sons and no daughter and 61 percent with one son and one daughter, compared with 42 percent with no sons and two daughters, use a method of family planning.

Contraceptive use at last sex as reported by currently married men is slightly higher than women's report of current contraceptive use. Fifty-three percent of currently married men report using contraception the last time they had sex; men are slightly more likely than women to report current use of condoms, however.

What contraceptive methods do women use? Currently married women

The vast majority of sterilized women (89\%) had the operation in a government facility, usually in a government/municipal hospital or in a Community Health Centre (CHC), rural hospital, or Primary Health Centre (PHC). Similarly, the majority of users of IUD (70\%) had their IUD insertion in the public medical sector. However, 85 percent of pill users and 52 percent of condom users got their most recent supply from the private medical sector.

Contraceptive Prevalence Rate by State
Percentage of currently married women

Despite a 10 percentage point increase in current contraceptive use among currently married women since NFHS-2, Manipur continues to lag behind most other states in contraceptive prevalence.

According to women's reports, among users for whom the brand is known, most are pill users ( $93 \%$ ), but only 28 percent of condom users use social marketing brands. According to men's reports, 34 percent of condom users for whom the brand is known, use social marketing brands.

> In Manipur, withdrawal, a traditional contraceptive method, is the most popular method of contraception among currently married women.

The one-year discontinuation rate of modern spacing methods in Manipur is higher than the national average. In Manipur, 49 percent of users of any modern spacing method discontinue use within a year of method adoption, compared with 42 percent in India as a whole. Discontinuation of condoms and pills is particularly high. Fifty-eight percent of condom users and 54 percent of the users of pills discontinue use within the first year after they adopted the method; discontinuation is also quite high for the most commonly used method, withdrawal, at 41 percent. Thirty-six percent of rhythm method users discontinue use within one year.

## Informed choice

Women who know about several contraceptive methods and their side effects can make better choices about what method they prefer. Less than half of modern contraceptive users (45\%) were told by a health or family planning worker about any side effects of their method, and nearly two-fifths ( $39 \%$ ) were told what to do if those side effects occurred. Thirty-eight percent were told about other methods they could use. IUD users were more likely than pill or sterilization users to have been provided this information.

## Men's attitudes

Most men in Manipur reject the idea that contraception is women's business and a man should not have to worry about it ( $75 \%$ ). However, 44 percent of men agree that women who use contraception may become promiscuous and 58 percent of men incorrectly believe that women who are breastfeeding cannot become pregnant. Over four-fifths of men ( $83 \%$ ) know that a condom, if used correctly, protects against pregnancy most of the time.

## Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop child-bearing entirely but are not using contraception. According to this definition, 12 percent of currently married women have unmet need for family planning, down from 24 percent in NFHS-2 and 22 percent in NFHS-1. Currently, 80 percent of the demand for family planning in Manipur is being met, up from 62 percent in NFHS-2 and NFHS-1.

## Infant and Child Mortality

The infant mortality rate in Manipur in the five years preceding the survey has been steadily declining. The infant mortality rate is currently estimated at 30 deaths before the age of one year per 1,000 live births, down from the NFHS-2 estimate of 37 and the NFHS-1 estimate of 42. Infant mortality in Manipur is lower than in all other states of India, except Goa and Kerala. Nonetheless, 1 in 34 children still die within the first year of life, and about 1 in 24 die before reaching age five.

Trends in Infant Mortality
Deaths per 1,000 live births

All infant and child mortality rates are about the same in both urban and rural areas of the state. In Manipur, both the infant mortality and the under-five mortality rates are much higher for boys than for girls. For example, the infant mortality rate for boys is 42 per 1,000, compared with only 30 per 1,000 for girls.

Children born to mothers under age 20 or over age 30 are more likely to die in infancy than children born to mothers in the prime childbearing ages. In Manipur, the infant mortality rate for teenage mothers is three times as high as the infant mortality rate for mothers in the age group 20-29 years

High-risk births have higher mortality rates
Deaths in the first year of life per 1,000 live births

Having children too close together is especially risky. Children born less than two years after a previous birth have a risk of dying before their first birthday which is about twice as high as for children whose mothers waited two or more years between births.

Children whose mothers have no education are about three times more likely to die before their first birthday as children whose mothers have completed 10 or more years of schooling. In addition, Muslim children, for whom the infant mortality rate in Manipur is 60 per 1,000 births, followed by children belonging to the scheduled tribes ( 51 per 1,000 ) and Christian children ( 50 per 1,000 ), have a much greater risk of dying than children in all other socio-economic categories.

## Infant Mortality Rate by State

Deaths per 1,000 live births

> The infant mortality rate in Manipur is third lowest in the country; after Goa and Kerala

## Perinatal Mortality

Perinatal mortality, which includes stillbirths and very early infant deaths (in the first week of life), is estimated at 26 deaths per 1,000 pregnancies that lasted 7 months or more. Perinatal mortality does not vary by urban-rural residence in Manipur, but is much lower among women with 10 or more years of education than women with no education and those with less than five years of education. Birth intervals also have a strong effect on perinatal mortality. For pregnancies that take place at least 39 months after a previous birth, the perinatal mortality rate is only 15 per 1,000, compared with $24-29$ per 1,000 for birth intervals less than 39 months. The perinatal mortality rate is also relatively high for first pregnancies at 34 per 1,000. (Data for perinatal mortality are not shown in the tables).

## Maternal Health

## Antenatal care

In Manipur, 87 percent of women who gave birth in the five years preceding the survey, received antenatal care from a health professional ( $83 \%$ from a doctor and $3 \%$ from other health personnel). Younger women were more likely than older women to receive antenatal care, as were women with more education and women having their first child. About one in eight women received no antenatal care. Among rural women with a birth in the five years preceding the survey, however, 17 percent did not receive any antenatal care.

Three or More Antenatal Care Visits by State
Percentage of last births in the past five years

> Despite the fairly high coverage of any antenatal care for pregnant women, only 69 percent of women in Manipur received at least three antenatal care visits for their last birth.

Almost all women in the highest wealth quintile and more than nine out of ten women with a first birth, urban women, Hindu women, and women with at least 10 years of education received antenatal care. Further, at least nine out of ten women belonging to all caste/tribe groups, except the scheduled tribes, received antenatal care. By contrast, only 69 percent of scheduled-tribe women received any antenatal care. Women belonging to the Christian religion and to the poorer quintiles are also less likely than most other women to receive antenatal care.

Are mothers getting timely, appropriate antenatal care?
Percentage of last births in the past three years

Sixty-five percent of women received antenatal care during the first trimester of pregnancy, as is recommended. Another 14 percent had their first antenatal care visit during the fourth or fifth month of pregnancy (data not shown in tables). Nearly 7 in 10 mothers ( $69 \%$ ) had three or more antenatal care visits. Women in urban areas were much more likely than women in rural areas to have three or more ANC visits and to have the first visit in the first trimester of pregnancy.

The proportion of women who received three or more antenatal care visits and the proportion who had their first antenatal
care visit in the first trimester of pregnancy for their last births have both increased significantly in Manipur in the seven years since NFHS-2.

In Manipur, less than two-thirds of women with a live birth in the past five years received or bought iron and folic acid (IFA) supplements during their last pregnancy and only 13 percent consumed them for the recommended 90 days or more. Seventy-nine percent received two or more tetanus toxoid injections. Only 3 percent took a deworming drug during pregnancy.

In general, more than four-fifths of women who received antenatal care, received some but not all of the services needed to monitor their pregnancy. Ninety-four percent had their abdomen examined, 91 percent had their blood pressure measured, and 84 percent had their weight taken. However, only 72 percent had a urine sample taken and only 66 percent had a blood sample taken. Even fewer, 37 percent, were told what to do if they had pregnancy complications.

An ultrasound test was performed during 22 percent of pregnancies in the five years preceding the survey. This proportion is slightly lower than the national average ( $24 \%$ ). One in three pregnancies among women in urban areas had an ultrasound test, compared with 17 percent of pregnancies among women in rural areas. Women with at least 10 years of education were almost four times as likely ( $38 \%$ ) to have an ultrasound test as women with no education (10\%). Only 2 percent of pregnancies among women in the lowest wealth quintile had an ultrasound test, compared to 55 percent among women in the highest wealth quintile. Pregnant women with no living son are much more likely to have an ultrasound test than women with one or more sons.

## Delivery care

Less than half of births in Manipur take place in a health facility; and more than half take place at home. However, the percentage of births taking place in a health facility has increased steadily over time from 23 percent in NFHS-1 to 49 percent in NFHS-3.

Home births are more common among births in rural areas and births at higher birth orders, and among births to mothers who are less than 20 years of age, have no education, are Christian, belong to the scheduled tribes, or belong to the lower wealth quintiles. Notably, only 9 percent of births to mothers with no antenatal check-up
 were delivered in a health facility, compared with 70 percent of births to mothers with four or more antenatal care visits.

For 89 percent of home births, a clean blade was used to cut the cord, as is recommended, but only 46 percent of home births followed the recommendation that the baby be immediately wiped dry and then wrapped without being bathed first.

Institutional Delivery by State
Percentage of births in the past five years

> Less than half of births in
> Manipur are
> delivered in a health facility, only somewhat more than in the nation as a whole.

In Manipur, only 59 percent of births in the past five years were assisted by health personnel, including 47 percent that were assisted by doctors. Almost one in three births (31\%) was assisted by a traditional birth attendant. Ten percent were delivered by a relative or other untrained person. Notably, only one in four home births was assisted by health personnel. A disposable delivery kit (DDK) was used for half of the home births.

## Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. Only 46 percent of mothers had a postnatal check-up within 2 days of their last birth, as is recommended; about half of women receive no postnatal care at all. Postnatal care is most common following births in a health facility; nonetheless, even in health facilities, about one in 12 births was not followed by a postnatal check-up of the mother. Only 9 percent of home births were followed by a postnatal check-up.

## Male involvement in maternal care

Eighty-eight percent of men with a child under three years of age said that the child's mother received antenatal care. Only 54 percent of men with a child under three years said they were present during at least one antenatal check-up received by the child's mother; 43 percent were told by a health provider or health worker what to do if the mother had a major pregnancy complication, and only 17-29 percent were told about specific signs of pregnancy complication.

Over half of fathers with a child less than three years of age were provided information related to maternal care: 69 percent were told about the importance of proper nutrition for the mother during pregnancy and 56 percent were told about the importance of delivering the baby in a health facility. Among fathers whose child was not delivered in a health facility, 70 percent
were told about keeping the baby warm immediately after birth, 67 percent were told about the importance of cleanliness at the time of delivery, 65 percent were told about the importance of using a new or unused blade to cut the umbilical cord, and 55 percent were told about the importance of breastfeeding the baby. Fathers in urban areas were somewhat more likely than fathers in rural areas to be provided most of this information.

## Child Health

## Vaccination of children

Less than half ( $47 \%$ ) of children 12-23 months of age in Manipur are fully vaccinated against the six major childhood illnesses: tuberculosis, diphtheria, pertussis, tetanus, polio, and measles. However, most children are at least partially vaccinated: only 7 percent have received no vaccinations at all.

Eighty percent of children age 12-23 months has received the BCG vaccination and 78 percent have received at least the recommended three doses of the polio vaccine. However, only 53 percent have been vaccinated against measles, and only 61 percent have received all the recommended doses of DPT.

Trends in Vaccination Coverage Percentage of children 12-23 months receiving vaccinations

Full vaccination coverage has increased by only 5 percentage points in Manipur in the seven years since NFHS-2, from 42 percent at the time of NFHS-2 to 47 percent. However, there has been greater improvement in some of the individual vaccines. For example, the coverage increased of three doses of the polio vaccine by 15 percentage points, of the BCG vaccine by 9 percentage points, and of the measles vaccine by 7 percentage points. However, there were only marginal improvements in the coverage of three doses of the DPT vaccine and a decline in the coverage of polio 0 .

Full Immunization Coverage by State
Percentage of children 12-23 months

> Despite some increase in full immunization coverage in the period since NFHS-2, less than half the children age 12-23 months in Manipur are fully immunized.

Full immunization coverage increases with wealth and with the mother's level of education, and children in urban areas are more likely to be fully vaccinated than children in rural areas. Sixty-six percent of Hindu children are fully vaccinated, compared with only 23 percent of Christian and 33 percent of Muslim children. Children belonging to the scheduled tribes also have very low rates of full immunization ( $23 \%$ ). Boys are much more likely than girls to be fully vaccinated ( $52 \%$ of boys compared with $41 \%$ of girls).

## Childhood illnesses

In the two weeks before the survey, 5 percent of children under age five had symptoms of an acute respiratory infection (cough and short, rapid breathing that was chest-related and not due to a blocked or runny nose). Of these children, less than half ( $45 \%$ ) were taken to a health facility or health provider.

Thirteen percent of children were reported to have had fever in the two weeks preceding the survey; 44 percent of these children were taken to a health facility or provider for treatment, and about 2 percent received anti-malarial drugs.

Overall, 10 percent of children had diarrhoea in the two weeks preceding the survey. Among these children, 38 percent were taken to a health provider for treatment. About half the children ( $48 \%$ ) were treated with some kind of oral rehydration therapy (ORT) or increased fluids, including 36 percent who were treated with a solution prepared from oral rehydration salt (ORS) packets and 13 percent who were given gruel. ORS use in treating diarrhoea among children remains very low, even though almost nine out of $10(88 \%)$ mothers of young children have heard of ORS.

Twenty-one percent of children with diarrhoea did not receive any type of treatment at all. Nineteen percent received antibiotics, which are not normally recommended for treating childhood diarrhoea.

Children should receive more fluids than usual during diarrhoeal illness; but in Manipur, only 13 percent received more liquids than normal. Thirty percent of children with diarrhoea received less to drink than normal or did not receive anything to drink, which can increase the risk of dehydration.

## Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based anganwadi centres. Among the 89 percent of children under six years in Manipur who are in areas covered by an anganwadi centre, less than one-third ( $30 \%$ ) receive services of some kind from a centre. The most common services children age 0-71 months in areas covered by an anganwadi centre receive are supplementary food ( $21 \%$ ), followed by immunizations ( $12 \%$ ). Only 11 percent of children age $3-5$ years received early childhood care or preschool services and only 1 percent of children under age 5 years were weighed at an anganwadi centre.

Use of anganwadi centre services is higher in rural than in urban areas, as expected; and is lowest for children belonging to the highest wealth quintile. Children whose mothers have only 5-9 years of education are more likely than children of mothers with more or less education to receive services. Muslim and Christian children are more likely than children of other religions to receive services. Similarly, children belonging to the scheduled tribes and other backward classes are more likely to receive services than children belonging to the scheduled castes and children not belonging to the scheduled castes, scheduled tribes, and other backward classes.

How many children receive anganwadi centre services?
Percentage of age-eligible children in areas covered by an anganwadi centre receiving services

Among children under age six years in areas covered by an anganwadi centre, only 4 percent had mothers who received any service during pregnancy, and marginally more children had mothers ( $7 \%$ )who received any service when breastfeeding.

## Breastfeeding, Nutrition, and AnaEmiA

## Infant feeding

Although breastfeeding is nearly universal in Manipur ( $96 \%$ ), only 62 percent of children under 6 months of age are exclusively breastfed, as the World Health Organization (WHO) recommends. Only 80 percent of infants are put to the breast within the first day of life, including 58 percent who started breastfeeding in the first hour of life, which means that many infants are deprived of the highly nutritious first milk (colostrum) and the antibodies it contains. However, mothers in Manipur breastfeed for an average of 33 months, which is longer than the minimum of 24 months recommended by WHO for most children.

It is recommended that nothing be given to children other than breast milk even in the first three days when the milk has not begun to flow regularly. However, 38 percent of children are given something other than breast milk during that period. The median duration of exclusive breastfeeding among last-born children is 3.4 months.

WHO offers three recommendations for infant and young child feeding (IYCF) practices for children 6-23 months old: continued breastfeeding or feeding with appropriate calcium-rich foods if not breastfed; feeding solid or semi-solid food for a minimum number of times per day according to age and breast-feeding status; and, including foods from an appropriate number of food groups per day according to breastfeeding status. Less than two-thirds of children age 6-23 months are fed the recommended minimum times per day and more than half $(55 \%)$ are fed from the appropriate number of food groups. Only 41 percent of children are fed according to all three recommended practices.

Vitamin A deficiency can cause eye damage and a higher risk of dying from measles, diarrhoea, or malaria. The Government of India recommends that children under three years of age receive vitamin A supplements every six months, starting at age 9 months. However, only 15 percent of last-born children age 12-35 months was given a vitamin A supplement in the past six months, and only 76 percent of children age 6-35 months ate vitamin A-rich foods during the day or night before the interview.

Eating foods rich in iron and taking iron supplements can prevent anaemia. Only 59 percent of women's youngest children age 6-35 months ate iron-rich foods during the day or night before the interview, and only 2 percent of children age 6-59 months were given iron supplements in the week before the interview.

## Children's nutritional status

Thirty-six percent of children under age five are stunted, or too short for their age, which indicates that they have been undernourished for some time. Nine percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness. Over one-fifth ( $22 \%$ ) are underweight, which takes into account both chronic and acute undernutrition.

Even during the first six months of life, when most babies are breastfed, 21 percent of children in Manipur are wasted and 8-10 percent is stunted or underweight. Children in rural areas are more likely to be undernourished; but even in urban areas, 30 percent of children suffer from chronic undernutrition. Although children's nutritional status improves with wealth, 19 percent of children even in highest wealth quintile are stunted. Children belonging to the scheduled tribes, Muslim and Christian children, children of mothers with less education, and children belonging to the lowest wealth quintile are more likely than other children to be undernourished. Although girls in Manipur are about equally likely as boys to be wasted or stunted, they are more likely than boys to be underweight.

Children's nutritional status in Manipur has improved since NFHS-2 according to only one of the three measures. Children under age three (the age group for which nutritional status data are available in NFHS-2) are less likely to be short for their age today than they were seven years ago, which means chronic

Trends in Children's Nutritional Status Percentage of children under three years

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population undernutrition has been reduced; however, they are about as likely to be underweight or to be wasted as at the time of NFHS-2, which means that undernutrition is still a major problem in the state.

## Adults' nutritional status

Adults in Manipur suffer a dual burden of malnutrition; 15 percent of women and 16 percent of men are too thin and 13 percent of women and 9 percent of men are overweight or obese. About threefourths of men ( $74 \%$ ) and women ( $72 \%$ ) are at a healthy weight for their height. Notably, the percentage of ever-married women who are too thin has declined from 19 percent in NFHS-2 to 14 percent in NFHS-3.

Undernutrition is particularly serious among women and men, who are 15-19 years of age, are never married or not currently married, are Muslim, or belong to the lowest wealth quintile. Further, among men, those with less than five years of education are more likely to be too thin.

How many women are at a healthy weight for their height?
Percent distribution of women

Overweight and obesity are most common in older adults, those in urban areas, the welleducated, and those in the highest wealth quintile. In general, because, in Manipur, as in other states, population groups that are less likely to be too thin are the same groups that are more likely to be overweight or obese, the percentage suffering from either of these two nutritional problems varies within a narrow range of values across most categories of men and women (typically between one-quarter and one-third).

## Anaemia

Anaemia is a major health problem in India, especially among women and children. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, prenatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Among children between the ages of 6 and 59 months in Manipur, over twofifths $(41 \%)$ are anaemic. This includes 26 percent who are mildly anaemic, 15 percent who are moderately anaemic, and less than 1 percent who suffer from severe anaemia.

Boys are slightly more likely to have anaemia than girls; and the percentage of children who have anaemia declines sharply with children's age, from 67 percent among children age 6-11 months to 23 percent among children age 48-59 months. Children of mothers who are anaemic are more likely to have anaemia.

Although anaemia levels vary somewhat according to selected background characteristics, anaemia among children is widespread in every group. Thirty-five percent of children even in the highest wealth quintile are anaemic.

Thirty-six percent of women age 15-49 in Manipur have anaemia, including 30 percent with mild anaemia, 5 percent with moderate anaemia, and 1 percent with severe anaemia. Anaemia is less widespread among women who are less than 20 years of age, are never married, are Christian, or belong to the scheduled tribes. Anaemia is particularly high for women who are breastfeeding ( $46 \%$ ), and is also more prevalent among pregnant women ( $37 \%$ ) than women who are neither pregnant nor breastfeeding

Anaemia among Women, Men, and Children
 (32\%). Scheduled-caste women are more likely than women in any other category to be anaemic.

Anaemia is more widespread now among both women and children than it was seven years ago at the time of NFHS-2. Among children age 6-35 months, the prevalence of anaemia has risen by 8 percentage points from 45 percent in NFHS-2 to 53 percent in NFHS-3. Similarly, among ever-married women, the prevalence of anaemia has risen by 10 percentage points from 29 percent in NFHS-2 to 39 percent seven years later in NFHS-3.

Eleven percent of men age 15-49 in Manipur are anaemic, including 7 percent who are mildly anaemic, 4 percent who are moderately anaemic, and less than 1 percent who are severely anaemic. The prevalence of anaemia among men declines sharply with wealth from 15 percent for men in the lowest wealth quintile to 8 percent among men in the highest wealth quintile. However, it varies little by most other background characteristics.

## HIV/AIDS

## Awareness of AIDS

Knowledge of HIV/AIDS among adults, women and men, is nearly universal in Manipur $(99 \%)$ and is higher than in any other Indian state. More women know about AIDS now than in the late 1990s: 93 percent of ever-married women in NFHS-2 had heard of AIDS, compared with 99 percent of ever-married women in NFHS-3.

## Knowledge of prevention and transmission

Men are much more likely than women to know how HIV is transmitted and how to keep from getting it. For example, 79 percent of women know that consistent condom use can help prevent HIV/AIDS, compared with 92 percent of men; and 81 percent of women know that having just one uninfected faithful partner can reduce the chance of getting HIV/AIDS, compared with 92 percent of men. Even in the rural areas and among those with little education, men are much more likely than women to know how HIV can be transmitted and prevented.

Only 44 percent of women and 61 percent of men have 'comprehensive knowledge' of HIV/AIDS. This means that they know that a healthy-looking person can have HIV/AIDS, that HIV/AIDS cannot be transmitted through mosquito bites or by sharing food, and that condom use and having only one faithful, uninfected partner can help prevent HIV/AIDS.

Do people know how to prevent HIV/AIDS?
Percentage of women and men age 15-49

## HIV-related stigma

Among adults who have heard of AIDS in Manipur, more than three-fourths (79\% of women and $90 \%$ of men) would be willing to take care of a family member with HIV/AIDS in their home; 74 percent of women and 84 percent of men say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching, and 72 percent of women and 82 percent of men way that they are comfortable buying fresh vegetables from a shopkeeper with HIV/AIDS. Nine in 10 women and men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret. Overall, however, only 56 percent of women and 70 percent of men express all four of these accepting attitudes toward persons living with HIV/AIDS.

HIV testing prior to NFHS-3, blood transfusions, and safe injections
Only 9 percent of women and men age 15-49 had ever been tested for HIV prior to NFHS-3, 8 percent in rural areas and 9-10 percent in urban areas.

In Manipur, a higher proportion of women (4\%) than men (3\%) have ever had a blood transfusion. Women are also more likely than men ( $22 \%$ of women, compared with $17 \%$ of men) to have received an injection from a health worker in the past year. Men and women in urban areas are more likely than their counterparts in rural areas to have received an injection from a health worker in the past year.

For almost all women ( $98 \%$ ) and men ( $99 \%$ ) who received an injection from a health worker in the past 12 months, the last injection was 'safe', i.e., the syringe and needle was taken from a newly opened package or the needle used had been sterilized

## HIV prevalence

In Manipur, 91 percent of women age 15-49 and 82 percent of men age 15-54 eligible for interview in all sample households provided blood for HIV testing. Among all eligible respondents, 2 percent refused to provide blood, 3 percent were not available at the time of blood collection, and 8 percent were not eligible for HIV testing because they could not be interviewed. Response rates are similar for men and women, are slightly higher in rural than urban areas, and do not vary much by age.

In Manipur, the overall HIV prevalence rate among adults age 15-49 is 1.13 percent; among women age $15-49$, the prevalence is 0.76 percent and among men age $15-49$, the prevalence is twice as high at 1.59 percent. The prevalence among youth (age 15-24), at 0.39 percent, is much lower than for the reproductive age population as a whole. Notably, in Manipur, there is no gender difference in the prevalence of HIV among youth. (HIV prevalence data are not shown in the tables.)

Manipur has the highest prevalence of HIV among
 the five high HIV prevalence states for which NFHS-3 provides separate HIV estimates (namely, Andhra Pradesh, Karnataka, Maharashtra, Manipur, and Tamil Nadu). The prevalence of HIV in Manipur is five times as high as the national prevalence rate of 0.28 percent of adults age 15-49 ( 0.35 in urban areas and 0.25 in rural areas).

In mid-2007, NACO undertook an exercise in consultation with Indian and international experts in HIV estimation to revise the official HIV estimates. The revision of the official estimates was done based on the NFHS-3 household-based estimate of HIV in the population age 15-49 years, estimates of HIV from the expanded sentinel surveillance system, and related information about HIV in high-risk groups that do not live in households. The revised HIV
estimate of 2.47 million persons in India living with HIV (equivalent to $0.36 \%$ of the adult population) was released by NACO in July 2007. This national estimate reflects the availability of improved data rather than a substantial decrease in actual HIV prevalence in India.

## Sexual Behaviour

NFHS-3 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, and condom use. Additionally, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

## Age at first sexual intercourse

Less than half of women ( $44 \%$ ) in Manipur have had sexual intercourse by the time they are 21 years of age, compared with 14 percent among men. The median age at first sexual intercourse for women is 22.3 years. Among youth 15-24 years of age, women are much more likely than men to have ever had sex ( $27 \%$ of women, compared with $15 \%$ of men). The earlier age at sexual intercourse for women than men is a consequence of the fact that in India first sexual intercourse largely occurs within marriage and women marry at younger ages than men. Notably, among never married youth, 1 percent of women and 5 percent of men have had sexual intercourse.

## Higher-risk sex and multiple sex partners

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past year, only 0.3 percent of women and 3 percent of men reported having had higher-risk sex during the year. One percent of male respondents said they had multiple sex partners in the past year, but insignificant numbers of female respondents reported having multiple partners.

## Use of condoms during higher-risk sex

Among men reporting higher-risk sex in the past 12 months, 51 percent said they had used a condom the last time they had higher-risk sex.

## Paid sex

Less than 1 percent of men age 15-49 said they had paid for sex in the 12 months preceeding the survey.

## Adult Health and Health Care

## Tuberculosis

In Manipur, 804 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. Prevalence of tuberculosis is twice as high among men $(1,123)$ than among women (504) and is also twice as high in rural (958) than urban (477) areas. Notably, the prevalence of tuberculosis is higher in Manipur than in all other states of India, except Arunachal Pradesh, and is twice as high as the national average.

Nearly all respondents have heard of tuberculosis ( $97 \%$ of women and $98 \%$ of men), but even among people who have heard of tuberculosis, only 71 percent of women and 77 percent of men say that it is spread through the air by coughing or sneezing. Over two-fifths of women $(44 \%)$ and more than one-third of men (37\%) have misconceptions about how tuberculosis is spread. However, about nine out of ten women and men know that tuberculosis can be cured and only 6 percent of women and 4 percent of men say that if a family member had tuberculosis, they would want to keep it a secret from the neighbours.

## Diabetes, asthma, and goitre

According to self reports, 1 percent each of women and men age 15-49 in Manipur suffer from diabetes. Diabetes is particularly prevalent at higher ages. The prevalence of diabetes in the age group 35-49 is 2 percent for both women and men.

One percent of adults suffer from asthma (1,400 per 100,000 women and 1,106 per 100,000 men). Asthma increases sharply with age for women and varies inconsistently with age for men; however, even among men, the prevalence of asthma is highest for the age group 35-49. The prevalence of goitre or other thyroid disorders is substantially higher for women than for men ( 2,623 women, compared with 1,389 men per 100,000). Notably, the prevalence of goitre among both women and men is higher in Manipur than in all other states of India, except Kerala.

## Tobacco and alcohol use

In Manipur, tobacco and alcohol use is higher among men than among women. Sixty-nine percent of men, compared with 40 percent of women use some form of tobacco, including 36 percent of pregnant women (data for pregnant women not shown in tables). Women and men who use tobacco are most likely to chew tobacco in the form of paan masala, gutkha, or other tobacco ( $38 \%$ of women and $58 \%$ of men). Among men, smoking cigarettes or bidis is also quite common ( $38 \%$ ).

Women and men are more likely to use tobacco than to consume alcohol. Less than half of men $(47 \%)$ and 2 percent of women drink alcohol. Forty-nine percent of men who drink, consume alcohol once a week or more frequently.

## Source of health care

For about four-fifths of households in Manipur the public medical sector is the main source of health care $(82 \%$ in rural areas and $72 \%$ in urban areas). Wealthier households are less likely to use the public medical sector than households in the lower quintiles. However, for a majority ( $64 \%$ ) of even households belonging to the highest wealth quintile, the public medical sector is the main source of health care. Among households that do not use government health facilities, the main reasons given for not doing so are poor quality of care ( $46 \%$ ), lack of a nearby facility ( $30 \%$ ), and inconvenient facility timing ( $20 \%$ ) (data not shown in tables).

## Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, only 7 percent of households in Manipur report that they have any kind of insurance that covers at least one member of the household. Two types of programmes dominate: medical
reimbursement from employer and the Employee State Insurance Scheme (ESIS). Health insurance is twice as common in urban as in rural areas, and increases sharply with the wealth index. Eighteen percent of households in the highest wealth quintile have at least one household member covered by some type of health insurance.

## Women's Empowerment

## Employment and earnings

Sixty-five percent of currently married women were employed in the last year, compared with 99 percent of currently married men; 14 percent of these women received no payment for their work, 13 percent received compensation in the form of both cash and kind, and 10 percent were paid only in kind. Overall, 76 percent of currently married employed women earn cash, as do three out four currently married employed men.

Among married women who work and are paid in cash, 96 percent decide how their earnings will be spent, either alone or jointly with their husbands. Twenty-six percent of women who work for cash earn about the same or more than their husbands.

## Decision making

Married women were asked who makes decisions on their own health care, making major household purchases, making household purchases for daily household needs, and visiting their own family or relatives. More than four out of five currently married women (81-86\%) participate in making each of these decisions. However, only 69 percent participate in making all four of these decisions and 3 percent do not participate in making any of the four decisions.

Participation in all four decisions increases sharply with age from 34 percent for women age $15-19$ to 77 percent for women age 40-49. Participation tends to decline with education and wealth quintile. Women in nuclear households and women who are employed for cash are more likely to participate in these household decisions.

## Other indicators of women's empowerment

Thirty-two percent of women have some money that they can decide how to use. The proportion of women with money which they control is highest for women who are widowed, divorced, separated, or deserted, belong to the scheduled castes, are employed for cash, belong to the highest wealth quintile, and have at least 10 years of education.

Only 8 percent of women have a bank or savings account that they themselves use, about half the national average ( $15 \%$ ). Although the majority of women in Manipur ( $65 \%$ ) have heard of a microcredit programme in the area, their use of such programmes is limited. Only 4 percent have ever taken a loan from a microcredit programme.

About three-fourths $(72 \%)$ of women are allowed to go by themselves to the market, 58 percent are allowed to go by themselves to a health facility, and 66 percent have freedom to travel alone outside their own village or community (data not shown in tables). Only 54 percent of women are allowed to go alone to all three of these places; however, the youngest women, never married women, and women with no children have much lower freedom of movement than other women.

> Only 8 percent of women in Manipur have a bank or savings account that they themselves use, about half the national average of 15 percent.

## Gender-role attitudes

About 90 percent of women and 85 percent of men in Manipur believe it is justifiable for a husband to beat his wife under some specified circumstances. Both women and men are most likely to say wife beating is justified if a woman shows disrespect for her in-laws ( $76 \%$ for women and $75 \%$ for men) or if she neglects the house or children ( $72 \%$ for women and $57 \%$ for men). Lower percentages of women and men ( $36 \%$ of women and $47 \%$ of men) say that it is justifiable for a husband to beat his wife if he suspects that she is unfaithful.

Nearly 9 in 10 women believe a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease ( $87 \%$ ), if she knows he has intercourse with other women $(89 \%)$, or if she is tired or not in the mood ( $83 \%$ ). Overall, 78 percent of women and 75 percent of men agree that a wife is justified in refusing to have sex with her husband for all of these reasons.

## Domestic Violence

Among women age 15-49 in Manipur, 37 percent have ever experienced physical violence since age 15 , and 10 percent have ever experienced sexual violence. In all, 39 percent of women have experienced physical or sexual violence, including 48 percent of ever-married women.

## Spousal violence

Almost two-fifths of ever-married women ( $38 \%$ ) report having been slapped by their husband; about one in ten ( $7-12 \%$ ) report having their arms twisted or hair pulled, being pushed, shaken, kicked, dragged, beaten up, or having something thrown at them. Three percent report that they were threatened or attacked by their husband with a weapon, and 1 percent report that their husband tried to choke or burn them on purpose. Fourteen percent report that their husband physically forced them to have sex and 6 percent report that their husband forced them to perform sexual acts that they did not want to perform. Overall, 44 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if currently not married, their most recent husband. Fourteen percent report spousal emotional violence. Only 2 percent of ever-married women have ever initiated violence against their husband.

Spousal Physical or Sexual Violence by State
Percentage of ever-married women

Although the prevalence of spousal violence is lower among the more educated, more than one in three women ( $37 \%$ ) who have at least 10 years of education have experienced spousal physical or sexual violence. Women whose mothers were beaten by their fathers are much more likely to be in abusive marriages themselves: 64 percent of women whose mothers experienced spousal violence have themselves experienced spousal, physical or sexual violence, compared with 38 percent of women whose mothers did not experience spousal violence. Women whose husbands consume alcohol and get drunk often are much more likely than women whose husbands do not consume any alcohol to experience spousal violence; however, 33 percent of even women whose husbands do not drink alcohol have experienced physical or sexual spousal violence.

About one in five women (22\%) who have experienced spousal physical or sexual violence have suffered injuries as a result of the violence. For most women who have ever experienced spousal violence, the violence first occurred within the first six years of their marriage (data not shown in tables).

## Help seeking

Only 17 percent of women who have ever experienced violence have sought help to end the violence. Two out of three women have neither sought help nor told anyone about the violence. Abused women most often seek help from their own families or their husbands' families. Friends are also an important source of help. Very few women seek help from any institutional source such as the police (less than $1 \%$ ) or social service organizations ( $2 \%$ ).

## Table 1 Results of the household and individual interviews

Number of households, number of interviews with women and men, and response rates, according to residence, Manipur, 2005-06

| Result | Urban | Rural | Total |
| :--- | :---: | :---: | :---: |
| Household interviews |  |  |  |
| $\quad$ Households selected | 1,643 | 2,067 | 3,710 |
| Households occupied | 1,580 | 1,965 | 3,545 |
| Households interviewed | 1,556 | 1,942 | 3,498 |
| Household response rate $^{1}$ | 98.5 | 98.8 | 98.7 |
| Interviews with women age 15-49 |  |  |  |
| $\quad$ Number of eligible women | 2,170 | 2,596 | 4,766 |
| $\quad$ Number of eligible women interviewed | 2,035 | 2,477 | 4,512 |
| Eligible women response rate ${ }^{2}$ | 93.8 | 95.4 | 94.7 |
| Interviews with men age 15-54 |  |  |  |
| $\quad$ Number of eligible men | 2,085 | 2,383 | 4,468 |
| $\quad$ Number of eligible men interviewed | 1,777 | 2,174 | 3,951 |
| Eligible men response rate ${ }^{2}$ | 85.2 | 91.2 | 88.4 |

Note: Eligible women and men are women age 15-49 and men age 15-54 who stayed in the household the night before the interview (including both usual residents and visitors). This table is based on the unweighted sample.
${ }^{1}$ Households interviewed/households occupied.
${ }^{2}$ Respondents interviewed/eligible respondents.

na $=$ Not applicable
${ }^{1}$ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.
${ }^{2}$ Total percentages may add to more than 100.0 because multiple answers are allowed.
${ }^{3}$ Houses made from mud, thatch, or other low-quality materials are called kachha houses, houses that use partly low-quality and partly high-quality materials are called semi-pucca houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called pucca houses.
${ }^{4}$ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes.

Table 4 Household possessions, ownership of agricultural land, and wealth index
Percentage of urban, rural, and total households and de jure population possessing various household goods, means of transport, agricultural land, a house, and farm animals and having a bank account, health insurance, a BPL card, and a mosquito net, and percent distribution by the wealth index, Manipur, 2005-06

| $25-29$ | 0.131 | 0.188 | 0.169 | 0.173 | 0.170 |
| $30-34$ | 0.131 | 0.139 | 0.136 | 0.153 | 0.128 |
| $35-39$ | 0.057 | 0.068 | 0.064 | 0.068 | 0.057 |
| $40-44$ | 0.015 | 0.013 | 0.013 | 0.026 | 0.010 |
| $45-49$ | 0.000 | 0.008 | 0.005 | 0.014 | $(0.000)$ |
| TFR 15-44 | 2.35 | 3.03 | 2.80 | 2.97 | 2.76 |
| TFR 15-49 | 2.35 | 3.07 | 2.83 | 3.04 | 2.76 |
| CBR | 21.6 | 26.8 | 25.0 | 26.1 | 24.4 |

Note: Rates are for the period 1-36 months preceding the survey (approximately 1990-92 for NFHS-1, 1996-98 for NFHS-2, and 2003-05 for NFHS-3). Age-specific fertility rates are expressed per woman. Rates for the age group 45-49 might be slightly biased due to truncation.
TFR $=$ Total fertility rate, expressed per woman
$C B R=$ Crude birth rate, expressed per 1,000 population
( ) Based on 125-249 unweighted woman years of exposure.

## Table 12 Fertility by background characteristics

Total fertility rates for the three years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility rates, by background characteristics, Manipur, 2005-06

| Background characteristic | Total fertility rate | Percentage currently pregnant | Mean number of children ever born to women age 40-49 years | Total wanted fertility rate |
| :---: | :---: | :---: | :---: | :---: |
| Residence |  |  |  |  |
| Urban | 2.35 | 5.4 | 3.4 | 1.94 |

| Number of users | 225 | 143 | 143 | 110 | 640 |

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status.
CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; NGO = Nongovernmental organization
() Based on 25-49 unweighted cases.
${ }^{1}$ Includes users of male sterilization and injectables, who are not shown separately.

Table 25 Informed choice
Among women who are current users of selected modern contraceptive methods who started the last episode of use within the five years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, and the percentage who were informed about other methods they could use, by method and initial source of method, Manipur, 2005-06

| Method/source | Percentage who were informed about side effects or problems of method used | Percentage who were informed about what to do if experienced side effects | Percentage who were informed by a health or family planning worker about other methods that could be used | Number of women |
| :---: | :---: | :---: | :---: | :---: |
| Method |  |  |  |  |
| Female sterilization ${ }^{1}$ | 40.1 | 28.7 | 23.3 | 58 |
| Pill | 35.3 | 27.5 | 39.2 | 118 |
| IUD | 56.7 | 54.5 | 43.7 | 123 |
| Initial source of method ${ }^{2}$ |  |  |  |  |
| Public medical sector | 53.6 | 46.8 | 41.1 | 137 |
| Private medical sector | 38.4 | 32.3 | 35.8 | 153 |
| Other | * | * | * | 9 |
| Total | 45.0 | 38.8 | 38.0 | 299 |

Note: Table includes only the contraceptive methods separately shown and excludes users who obtained their method from friends/relatives.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }_{2}^{1}$ Among women who were sterilized in the five years preceding the survey.
${ }^{2}$ Source at start of current episode of use.

## Table 26 First-year contraceptive discontinuation rates

Percentage of contraceptive users who discontinued use of a method within 12 months after beginning its use, by reason for discontinuation and percentage who switched to another method, by type of method, Manipur, 2005-06

| Method | Method failure | Desire to become pregnant | Side effects/health concerns | $\begin{aligned} & \text { Costs } \\ & \text { too } \\ & \text { much } \\ & \hline \end{aligned}$ | Infrequent sex/husband away | Marital dissolution/ separation | Other reason | Total | Switched to another method ${ }^{1}$ |

Note: Total includes women with missing information on religion, who are not shown separately.
${ }^{1}$ Unmet need for spacing includes pregnant women whose pregnancy was mistimed; amenorrhoeic women who are not using family planning and whose last birth was mistimed, or whose last birth was unwanted but now say they want more children; and fecund women who are neither pregnant nor amenorrhoeic, who are not using any method of family planning, and say they want to wait 2 or more years for their next birth. Also included in unmet need for spacing are fecund women who are not using any method of family planning and say they are unsure whether they want another child or who want another child but are unsure when to have the birth.
Unmet need for limiting refers to pregnant women whose pregnancy was unwanted; amenorrhoeic women who are not using family planning, whose last child was unwanted, and who do not want any more children; and fecund women who are neither pregnant nor amenorrhoeic, who are not using any method of family planning, and who want no more children. Excluded from the unmet need category are pregnant and amenorrhoeic women who became pregnant while using a method (these women are in need of a better method of contraception).
${ }^{2}$ Using for spacing is defined as women who are using some method of family planning and say they want to have another child or are undecided whether to have another. Using for limiting is defined as women who are using and who want no more children. Note that the ${ }_{3}$ specific methods used are not taken into account here.
${ }^{3}$ Nonusers who are pregnant or amenorrhoeic whose pregnancy was the result of a contraceptive failure are not included in the category of unmet need, but are included in total demand for contraception (since they would have been using had their method not failed).

Table 29 Age at first marriage
Percentage of women and men age 15-49 who were first married by specific exact ages, percentage never married, and median age at first marriage, first cohabitation with spouse, and first sex according to current age, Manipur, 2005-06

| 20-29 | 20.0 | 7.7 | 27.7 | 15.6 | 42.8 |
| 30-39 | 18.8 | 15.1 | 33.9 | 12.5 | 46.0 |
| 40-49 | * | * | * | * | * |
| Birth order |  |  |  |  |  |
| 1 | 30.1 | 8.0 | 38.1 | 11.2 | 48.9 |
| 2-3 | 20.0 | 9.1 | 29.0 | 14.0 | 42.6 |
| 4+ | 25.7 | 19.6 | 45.4 | 19.8 | 64.2 |
| Previous birth interval ${ }^{2}$ |  |  |  |  |  |
| $<2$ years | 40.7 | 20.2 | 60.8 | 21.6 | 81.1 |
| 2-3 years | 16.3 | 9.3 | 25.7 | 12.9 | 38.2 |
| 4 years or more | 19.2 | (12.1) | (31.3) | (15.1) | (46.0) |
| Total | 24.5 | 11.4 | 35.9 | 14.7 | 50.1 |

Note: Total includes births to women with missing information on religion and caste/tribe, who are not shown separately.
() Based on 250-499 unweighted cases.

* Based on fewer than 250 unweighted cases.
${ }^{1}$ Computed as the difference between the infant and neonatal mortality rates.
${ }^{2}$ Excludes first-order births.

Table 32 High-risk fertility behaviour
Percent distribution of children born in the five years preceding the survey by category of elevated risk of mortality and the risk ratio, and percent distribution of currently married women by category of risk if they were to conceive a child at the time of the survey, Manipur, 2005-06

|  | Births in the 5 years <br> preceding the survey | Percentage <br> of currently <br> married <br> (ercentage of <br> births | Risk <br> ratio |
| :--- | :---: | :---: | :---: |
| Romen ${ }^{1}$ |  |  |  |

Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category.
na $=$ Not applicable
( ) Based on 25-49 unweighted cases.

* Ratio not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or greater than 34 years and 2 months, latest birth less than 15 months ago, or latest birth of order 3 or higher.
${ }^{2}$ Includes the category age $<18$ and birth order $>3$.
${ }^{\text {a }}$ Includes sterilized women.

## Table 33 Antenatal care

Percent distribution of women who had a live birth in the five years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent live birth, according to background characteristics, Manipur, 2005-06

| Background characteristic | Doctor | ANM/nurse/ midwife/ LHV | Other health personnel | Dai/TBA | No one | Total | Number of women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age at birth |  |  |  |  |  |  |  |
| <20 | 83.7 | 1.9 | 0.0 | 3.6 | 10.7 | 100.0 | 100 |
| 20-34 | 84.1 | 2.6 | 0.2 | 0.4 | 12.7 | 100.0 | 1,195 |
| 35-49 | 75.7 | 2.9 | 0.7 | 0.7 | 19.9 | 100.0 | 174 |
| Birth order |  |  |  |  |  |  |  |
| 1 | 93.1 | 1.4 | 0.0 | 0.9 | 4.6 | 100.0 | 397 |

| Number of births | 439 | 1,030 | 1,469 |

NGO = Nongovernmental organization; ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant
${ }^{1}$ If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this tabulation.
${ }^{2}$ Based on the last live birth in the five years preceding the survey. Postnatal check-ups are checks on the woman's health within 42 days of the birth.

Table 38 Delivery and postnatal care by background characteristics
Percentage of live births in the five years preceding the survey delivered in a health facility and percentage delivered with assistance from health personnel and percentage of women who had a live birth in the five years preceding the survey who received a postnatal check-up and who received a postnatal check-up within two days of the most recent birth, by background characteristics, Manipur, 2005-06

| Background characteristic | Percentage of births delivered in a health facility | Percentage of deliveries assisted by health personnel ${ }^{1}$ | Number of births | Percentage of women with a postnatal check-up ${ }^{2,3}$ | Percentage of women with a postnatal check-up within two days of birth ${ }^{2}$ | Number of women |

Note: Total includes births to women with missing information on antenatal care visits and religion, who are not shown separately. na $=$ Not applicable
() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, or other health personnel.
${ }^{2}$ Based on the last live birth in the five years preceding the survey.
${ }^{3}$ Postnatal check-ups are checks on the woman's health within 42 days of the birth
${ }^{4}$ Includes missing.

## Table 39 Trends in maternal care indicators

Maternal care indicators for births during the three years preceding the survey, by residence, NFHS-3, NFHS-2, and NFHS-1, Manipur

| Indicator | NFHS-3 | NFHS-2 | NFHS-1 |
| :---: | :---: | :---: | :---: |
| URBAN |  |  |  |
| Percentage who received antenatal care ${ }^{1}$ | 95.2 | 92.0 | 78.4 |
| Percentage who had at least three antenatal care visits ${ }^{1}$ | 85.9 | 70.4 | 62.2 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 80.4 | 61.9 | 44.1 |
| Percentage of births delivered in a health facility ${ }^{2}$ | 71.2 | 52.4 | 39.8 |
| Percentage of deliveries assisted by health personnel ${ }^{2,3}$ | 85.2 | 68.1 | 64.2 |
| RURAL |  |  |  |
| Percentage who received antenatal care ${ }^{1}$ | 84.8 | 75.2 | 58.4 |
| Percentage who had at least three antenatal care visits ${ }^{1}$ | 64.0 | 48.6 | 32.6 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 59.2 | 38.0 | 25.8 |
| Percentage of births delivered in a health facility2 | 40.9 | 27.6 | 16.2 |
| Percentage of deliveries assisted by health personne ${ }^{2,3}$ | 52.8 | 48.5 | 30.0 |
| TOTAL |  |  |  |
| Percentage who received antenatal care ${ }^{1}$ | 87.7 | 79.9 | 64.3 |
| Percentage who had at least three antenatal care visits ${ }^{1}$ | 70.1 | 54.7 | 41.3 |
| Percentage who received antenatal care within the first trimester of pregnancy ${ }^{1}$ | 65.2 | 44.7 | 31.2 |
| Percentage of births delivered in a health facility ${ }^{2}$ | 49.3 | 34.5 | 23.0 |
| Percentage of deliveries assisted by health personnel ${ }^{2,3}$ | 61.7 | 53.9 | 39.9 |

[^5]Table 40 Male involvement in maternal care: Men's report
Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present during at least one antenatal care visit, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Manipur, 2005-06

| Antenatal/delivery care and information | Urban | Rural | Total |
| :---: | :---: | :---: | :---: |
| Percentage of men for whom the youngest child's mother received antenatal care | 96.5 | 84.8 | 88.4 |
| Percentage of men who were present at any antenatal care visit | 64.1 | 50.1 | 54.4 |
| Percentage who were told by a health provider or health worker about the following signs of pregnancy complications: |  |  |  |
| Vaginal bleeding | 19.7 | 20.4 | 20.2 |
| Convulsion | 15.7 | 17.2 | 16.7 |
| Prolonged labour | 30.4 | 27.7 | 28.6 |
| Percentage ever told what to do if mother had any pregnancy complication | 45.8 | 42.3 | 43.4 |
| Percentage whose youngest child was delivered in a health facility | 71.6 | 42.9 | 51.7 |
| Percentage to whom a health provider or worker spoke about the following aspects of maternal care: |  |  |  |
| The importance of delivering in a health facility | 63.2 | 52.7 | 55.9 |
| The importance of proper nutrition for the mother during pregnancy | 76.2 | 65.7 | 68.9 |
| Family planning or delaying his next child | 53.6 | 40.1 | 44.2 |
| Number of men with a child age 0-35 months | 263 | 599 | 861 |
| Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of: |  |  |  |
| Breastfeeding the baby immediately after birth | 68.4 | 52.1 | 55.0 |
| Keeping the baby warm immediately after birth | 72.4 | 69.2 | 69.8 |
| Cleanliness at the time of delivery | 76.5 | 65.4 | 67.4 |
| Using a new or unused blade to cut the cord | 70.4 | 64.0 | 65.1 |
| Number of men whose last child age 0-35 months was not delivered in a health facility | 75 | 342 | 416 |

| Table 41 Vaccinations by background characteristics |  |  |  |  |  |  |  |  |  |  |  |  |  |

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation units (SD) from the median of the 2006 WHO International Reference Population. Table is based on children with valid dates of birth (month and year) and valid measurements of both height and weight. Total includes children with missing information on size at birth, mother's education, religion, and mother's nutritional status, who are not shown separately.
$\mathrm{BMI}=$ Body mass index $\left(\mathrm{kg} / \mathrm{m}^{2}\right)$

* Not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Includes children who are below -3 standard deviations (SD) from the International Reference Population median.
${ }^{2}$ Excludes children whose mothers were not interviewed.
${ }^{3}$ First born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval.
${ }^{4}$ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
${ }^{5}$ Includes children whose mothers are deceased.

## Table 49 Initial breastfeeding

Percentage of children born in the five years preceding the survey who were ever breastfed, and for last-born children born in the five years preceding the survey who were ever breastfed, percentage who started breastfeeding within half an hour, one hour, and one day of birth and percentage who received a prelacteal feed, by background characteristics, Manipur, 2005-06

| Background characteristic | Percentage ever breastfed | Number of children | Percentage who started breastfeeding: |  |  | Percentage who received a prelacteal feed ${ }^{3}$ | Number of last-born ever breastfed children |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note: Table is based on children born in the last five years whether the children are living or dead at the time of interview. Total includes children with missing information on religion, who are not shown separately.
TBA $=$ Traditional birth attendant
() Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Includes children who started breastfeeding within half an hour of birth.
${ }^{2}$ Includes children who started breastfeeding within one hour of birth.
${ }^{3}$ Children given something other than breast milk during the first three days of life.
${ }^{4}$ Doctor, nurse, midwife, auxiliary nurse midwife, lady health visitor, or other health personnel.

Table 50 Breastfeeding status by age
Percent distribution of youngest children under three years living with the mother by breastfeeding status and percentage of all children under three years using a bottle with a nipple, according to age in months, Manipur, 2005-06

| Age in months | Not breastfeeding | Exclusively breastfed | Breastfeeding and consuming: |  |  |  | Total | Number of youngest children under three years | Percentage using a bottle with a nipple ${ }^{1}$ | Number of children |

| 18-23 | 17.5 | 0.0 | 0.7 | 0.7 | 0.0 | 81.1 | 100.0 | 175 | 2.8 | 185 |
| 24-35 | 29.7 | 0.0 | 0.0 | 0.0 | 0.0 | 70.3 | 100.0 | 335 | 5.6 | 414 |
| <4 | 0.7 | 72.1 | 5.5 | 3.3 | 5.8 | 12.6 | 100.0 | 110 | 9.2 | 112 |
| <6 | 1.1 | 62.1 | 6.5 | 3.8 | 6.4 | 20.1 | 100.0 | 180 | 12.9 | 181 |
| 6-9 | 1.6 | 11.0 | 6.5 | 0.4 | 0.7 | 79.6 | 100.0 | 164 | 7.4 | 164 |
| 12-23 | 12.9 | 0.0 | 0.4 | 0.7 | 0.0 | 86.1 | 100.0 | 341 | 4.0 | 354 |

Note: Breastfeeding status refers to a '24-hour' period (yesterday and last night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water only, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus any children who get complementary food are classified in that category as long as they are breastfeeding as well. Children who receive breast milk and non-milk liquids and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water.
() Based on 25-49 unweighted cases.
${ }^{1}$ Based on all children under three years.

| Total | 25.6 | 15.2 | 0.3 | 41.1 | 1,533 |
| Children age 6-35 months born to interviewed ever-married women |  |  |  |  |  |
| NFHS-3 (2005-06) | 30.3 | 21.9 | 0.6 | 52.8 | 854 |
| NFHS-2 (1998-99) | 22.6 | 21.7 | 0.9 | 45.2 | 457 |

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre ( $\mathrm{g} / \mathrm{dl}$ ). Total includes children with missing information on religion and mother's anaemia status, who are not shown separately.
( ) Based on 25-49 unweighted cases.

* Percentage not shown; based on fewer than 25 unweighted cases.
${ }^{1}$ Excludes children whose mothers were not interviewed
${ }^{2}$ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
${ }^{3}$ Includes children whose mothers are deceased.

Note: Prevalence of anaemia, based on haemoglobin levels is adjusted for altitude and for smoking status, if known, using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre ( $\mathrm{g} / \mathrm{dl}$ ). Total includes women with missing information on religion and caste/tribe and men for whom caste/tribe was not known or is missing, who are not shown separately.
na $=$ Not applicable
() Based on 25-49 unweighted cases.
${ }^{1}$ For pregnant women the value is $10.0-10.9 \mathrm{~g} / \mathrm{dl}$.
${ }^{2}$ For pregnant women the value is $<11 \mathrm{~g} / \mathrm{dl}$.

| Own friend/acquaintance | 3.7 | * | 4.8 |
| Teacher | 0.3 | * | 0.3 |
| Stranger | 0.6 | * | 1.6 |
| Other | 0.6 | * | 0.5 |
| Number who experienced sexual violence | 281 | 13 | 294 |

Note: All women were asked about their experience of physical violence since age 15. Evermarried women were also asked about their experience of spousal physical violence at any age.

* Percentage not shown; based on fewer than 25 unweighted cases.

Table 76 Forms of spousal violence
Percentage of ever-married women age 15-49 who have experienced various forms of violence committed by their husband ever or in the 12 months preceding the survey, Manipur, 2005-06

| Type of violence | Ever | In the past 12 months ${ }^{1}$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Often | Sometimes | Often or sometimes |
| Physical violence |  |  |  |  |
| Any form of physical violence | 40.7 | 2.1 | 22.2 | 24.3 |
| Pushed her, shook her, or threw something at her | 12.2 | 0.5 | 6.7 | 7.3 |
| Slapped her | 37.6 | 1.6 | 20.0 | 21.6 |
| Twisted her arm or pulled her hair | 7.3 | 0.6 | 4.4 | 5.0 |
| Punched her with his fist or with something that could hurt her | 8.2 | 0.5 | 4.5 | 5.1 |
| Kicked her, dragged her, or beat her up | 8.2 | 0.5 | 4.4 | 4.9 |
| Tried to choke her or burn her on purpose | 1.1 | 0.2 | 0.5 | 0.7 |
| Threatened her or attacked her with a knife, gun, or any other weapon | 2.9 | 0.6 | 1.4 | 2.0 |
| Sexual violence |  |  |  |  |
| Any form of sexual violence | 14.0 | 0.9 | 8.9 | 9.8 |
| Physically forced her to have sexual intercourse with him even when she did not want to | 13.6 | 0.9 | 8.4 | 9.3 |
| Forced her to perform any sexual acts she did not want to | 5.9 | 0.4 | 4.2 | 4.6 |
| Emotional violence |  |  |  |  |
| Any form of emotional violence | 13.9 | 1.8 | 7.3 | 9.1 |
| Said or did something to humiliate her in front of others | 7.5 | 1.2 | 4.4 | 5.5 |
| Threatened to hurt or harm her or someone close to her | 4.6 | 0.7 | 2.5 | 3.2 |
| Insulted her or made her feel bad about herself | 8.4 | 1.2 | 3.9 | 5.1 |
| Any form of physical and/or sexual violence | 43.8 | 2.6 | 25.7 | 28.4 |
| Any form of physical and sexual violence | 10.9 | 1.3 | 6.5 | 7.8 |
| Any form of physical and/or sexual and/or emotional violence | 46.2 | 3.4 | 27.7 | 31.1 |
| Any form of physical and sexual and emotional violence | 4.7 | 1.4 | 2.4 | 3.8 |
| Any violence by women against their husband ${ }^{2}$ | 1.9 | 0.0 | 1.0 | 1.0 |
| Number of ever-married women | 1,901 | 1,824 | 1,824 | 1,824 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.
${ }^{1}$ Excludes widows.
${ }^{2}$ Any violence by women against their husband when he was not already beating or physically hurting them.

Table 77 Spousal violence by background characteristics
Percentage of ever-married women age 15-49 by whether they have ever experienced emotional, physical, or sexual violence committed by their husband, according to background characteristics, Manipur, 2005-06

| Background characteristic | Emotional violence | Physical violence | Sexual violence | Physical or sexual violence | Emotional, physical, or sexual violence | Number of women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age |  |  |  |  |  |  |
| 15-19 | (19.6) | (30.2) | (14.5) | (33.3) | (34.8) | 56 |
| 20-24 | 11.7 | 35.7 | 13.5 | 40.8 | 43.8 | 247 |
| 25-29 | 16.2 | 41.4 | 17.6 | 44.9 | 48.4 | 338 |
| 30-39 | 13.0 | 42.0 | 13.0 | 44.8 | 46.4 | 732 |
| 40-49 | 14.2 | 41.8 | 13.3 | 44.1 | 46.9 | 528 |
| Residence |  |  |  |  |  |  |
| Urban | 13.0 | 40.8 | 14.9 | 44.4 | 47.3 | 598 |
| Rural | 14.3 | 40.6 | 13.6 | 43.5 | 45.7 | 1,303 |
| Education |  |  |  |  |  |  |
| No education | 13.4 | 43.8 | 13.3 | 46.9 | 48.6 | 586 |
| $<5$ years complete | 20.7 | 51.6 | 20.9 | 52.7 | 56.4 | 182 |
| 5-9 years complete | 15.3 | 41.0 | 15.9 | 44.4 | 47.4 | 583 |
| 10 or more years complete | 10.8 | 33.4 | 10.4 | 36.8 | 38.9 | 549 |
| Employment (past 12 months) |  |  |  |  |  |  |
| Employed | 15.0 | 45.4 | 16.0 | 48.5 | 50.9 | 1,249 |
| Employed, for cash | 17.3 | 47.6 | 17.2 | 50.8 | 53.4 | 962 |
| Employed, not for cash | 7.5 | 38.3 | 12.2 | 40.7 | 42.2 | 287 |
| Not employed | 11.8 | 31.7 | 10.1 | 34.9 | 37.3 | 651 |
| Marital status |  |  |  |  |  |  |
| Currently married | 12.8 | 39.2 | 13.8 | 42.5 | 44.9 | 1,761 |
| Widowed | 16.7 | 51.9 | 13.4 | 51.9 | 52.6 | 77 |
| Divorced/separated/deserted | (43.2) | (68.5) | (21.1) | (68.5) | (73.5) | 63 |
| Marital status and duration ${ }^{1}$ |  |  |  |  |  |  |
| Married only once | 12.2 | 38.7 | 13.5 | 41.9 | 44.2 | 1,699 |
| 0-4 years | 10.2 | 25.8 | 10.6 | 30.1 | 32.9 | 402 |
| 5-9 years | 11.2 | 41.5 | 14.2 | 45.6 | 47.5 | 395 |
| $10+$ years | 13.6 | 43.3 | 14.4 | 45.7 | 47.9 | 901 |
| Married more than once | 27.0 | 52.5 | 22.9 | 58.7 | 64.1 | 62 |
| Number of living children |  |  |  |  |  |  |
| 0 | 13.5 | 26.5 | 9.8 | 28.7 | 31.1 | 174 |
| 1-2 | 12.2 | 39.4 | 12.5 | 42.6 | 45.4 | 822 |
| 3-4 | 15.5 | 46.9 | 15.3 | 49.5 | 51.0 | 637 |
| $5+$ | 15.7 | 39.3 | 18.3 | 43.5 | 47.0 | 268 |
| Household structure ${ }^{2}$ |  |  |  |  |  |  |

| Other | 15.0 | 49.1 | 11.5 | 49.9 | 51.9 | 202 |
| Caste/tribe |  |  |  |  |  |  |
| Scheduled caste | 12.4 | 50.1 | 21.3 | 53.6 | 54.4 | 119 |
| Scheduled tribe | 11.9 | 31.0 | 11.4 | 34.3 | 36.4 | 471 |
| Other backward class | 19.0 | 40.5 | 19.4 | 46.6 | 49.8 | 197 |
| Other | 14.0 | 43.8 | 13.4 | 46.2 | 48.8 | 1,114 |
| Wealth index |  |  |  |  |  |  |
| Lowest | (16.3) | (34.3) | (14.6) | (37.7) | (41.1) | 47 |
| Second | 17.7 | 46.3 | 19.2 | 49.5 | 51.1 | 320 |
| Middle | 14.6 | 45.3 | 17.3 | 48.6 | 50.6 | 614 |
| Fourth | 12.5 | 38.4 | 10.6 | 41.3 | 44.9 | 623 |
| Highest | 11.1 | 31.1 | 8.6 | 33.8 | 35.4 | 298 |
| Respondent's father beat her mother |  |  |  |  |  |  |
| Yes | 20.7 | 56.8 | 19.9 | 61.0 | 64.2 | 547 |
| No | 10.7 | 32.7 | 11.8 | 35.5 | 37.6 | 1,267 |
| Don't know | 17.1 | 56.0 | 7.0 | 57.0 | 57.6 | 82 |
| Total | 13.9 | 40.7 | 14.0 | 43.8 | 46.2 | 1,901 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women with missing information on employment (past 12 months), religion, caste/tribe, and whether respondent's father beat her mother, who are not shown separately.
( ) Based on 25-49 unweighted cases.
Currently married women only
${ }^{2}$ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.

Table 78 Spousal violence by husband's characteristics and empowerment indicators
Percentage of ever-married women age 15-49 who have ever suffered emotional, physical, or sexual violence committed by their husband, according to his characteristics, marital characteristics, and selected empowerment indicators, Manipur, 2005-06

| Husband's characteristic/empowerment indicator | Emotional violence | Physical violence | Sexual violence | Physical or sexual violence | Emotional physical, or sexual violence | Number of women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Husband's education |  |  |  |  |  |  |
| No education | 16.7 | 48.0 | 11.4 | 49.4 | 51.6 | 176 |
| $<5$ years complete | 18.6 | 42.0 | 14.5 | 42.7 | 47.3 | 131 |
| 5-7 years complete | 15.7 | 45.2 | 15.8 | 48.6 | 51.7 | 181 |
| 8-9 years complete | 14.8 | 43.1 | 16.1 | 46.0 | 48.7 | 444 |
| 10-11 years complete | 12.4 | 39.3 | 17.0 | 45.6 | 46.2 | 303 |
| 12 or more years complete | 11.0 | 34.7 | 11.1 | 37.4 | 39.4 | 614 |
| Husband's alcohol consumption |  |  |  |  |  |  |
| Does not drink | 11.6 | 29.6 | 11.1 | 33.3 | 35.6 | 788 |
| Drinks/never gets drunk | 10.8 | 41.0 | 7.1 | 41.8 | 43.3 | 251 |
| Gets drunk sometimes | 14.5 | 48.8 | 16.3 | 52.5 | 55.4 | 711 |
| Gets drunk often | 29.1 | 61.0 | 31.3 | 61.9 | 64.1 | 143 |
| Spousal age difference ${ }^{1}$ |  |  |  |  |  |  |
| Wife older | 23.0 | 49.9 | 16.3 | 52.0 | 56.0 | 100 |
| Wife is same age | 10.2 | 46.7 | 15.4 | 51.1 | 51.6 | 135 |
| Wife 1-4 years younger | 11.4 | 41.8 | 13.0 | 43.7 | 46.3 | 692 |
| Wife 5-9 years younger | 13.7 | 35.5 | 14.4 | 39.1 | 41.5 | 565 |
| Wife 10+ years younger | 11.7 | 32.5 | 12.8 | 38.8 | 41.2 | 266 |
| Spousal education difference |  |  |  |  |  |  |
| Husband better educated | 13.9 | 41.0 | 14.7 | 44.4 | 46.3 | 1,181 |
| Wife better educated | 11.5 | 33.6 | 13.0 | 37.9 | 40.3 | 317 |
| Both equally educated | 14.1 | 41.4 | 13.9 | 42.6 | 46.1 | 224 |
| Neither educated | 16.1 | 48.5 | 10.0 | 49.8 | 52.9 | 127 |
| Number of marital control behaviours displayed by husband $^{2}$ |  |  |  |  |  |  |
| 0 | 6.6 | 31.6 | 10.2 | 34.2 | 35.3 | 905 |
| 1-2 | 14.5 | 42.2 | 12.9 | 45.8 | 49.4 | 740 |
| 3-4 | 35.9 | 67.3 | 28.1 | 71.0 | 74.7 | 213 |
| 5-6 | (49.9) | (75.7) | (45.6) | (76.8) | (79.9) | 42 |
| Number of decisions in which women participate ${ }^{3}$ |  |  |  |  |  |  |
| 0 | 14.8 | 22.5 | 19.2 | 29.6 | 31.1 | 66 |

| 5-6 | 19.1 | 46.7 | 17.4 | 50.5 | 55.0 | 379 |
| 7 | 21.9 | 51.1 | 18.6 | 54.2 | 55.8 | 97 |
| Number of reasons given for refusing to have sexual intercourse with husband ${ }^{5}$ |  |  |  |  |  |  |
| 0 | 16.2 | 38.8 | 8.5 | 38.8 | 40.0 | 109 |
| 1-2 | 15.6 | 38.9 | 11.1 | 40.9 | 43.7 | 256 |
| 3 | 13.5 | 41.1 | 14.9 | 44.6 | 47.1 | 1,536 |
| Total | 13.9 | 40.7 | 14.0 | 43.8 | 46.2 | 1,901 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Table includes women with don't know/missing on husband's education, husband's alcohol consumption, spousal age difference, and spousal education difference, who are not shown separately.
() Based on 25-49 unweighted cases.
${ }^{1}$ Currently married women only.
${ }^{2}$ Behaviours include: he is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money.
${ }^{3}$ Currently married women only. Decisions included are decisions about own health care, major household purchases, purchases for daily household needs, and visits to her family or relatives.
${ }^{4}$ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook food properly, he suspects she is unfaithful, and she shows disrespect for in-laws.
${ }^{5}$ Reasons given for refusing to have sexual intercourse with husband include: she knows husband has a sexually transmitted disease, she knows husband has sex with other women, and she is tired or not in the mood.

Table 79 Injuries to women due to spousal violence
Percentage of ever-married women age 15-49 who have experienced specific types of spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Manipur, 2005-06

| Type of spousal violence experienced | Percentage of women who have had: |  |  |  |  | Number of ever-married women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Cuts, bruises, or aches | Severe burns | Eye injuries, sprains, dislocations, or burns | Deep wounds, broken bones, broken teeth, or any other serious injury | Any of these injuries |  |
| Experienced physical violence |  |  |  |  |  |  |
| Ever | 20.9 | 0.9 | 3.7 | 4.5 | 23.6 | 774 |
| In the past 12 months ${ }^{1}$ | 23.0 | 0.8 | 4.3 | 4.1 | 25.3 | 443 |
| Experienced sexual violence |  |  |  |  |  |  |
| Ever | 28.2 | 1.3 | 7.3 | 7.3 | 31.7 | 266 |
| In the past 12 months ${ }^{1}$ | 27.5 | 0.5 | 7.3 | 5.8 | 29.9 | 179 |
| Experienced physical or sexual violence |  |  |  |  |  |  |
| Ever | 19.7 | 0.8 | 3.4 | 4.1 | 22.1 | 832 |
| In the past 12 months ${ }^{1}$ | 20.7 | 0.6 | 4.0 | 3.7 | 22.9 | 517 |
| Experienced physical and sexual violence |  |  |  |  |  |  |
| Ever | 35.2 | 1.6 | 9.4 | 9.4 | 39.7 | 208 |
| In the past 12 months ${ }^{1}$ | 41.9 | 0.9 | 11.0 | 9.1 | 45.4 | 105 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.
${ }^{1}$ Excludes widows.

## Table 80 Help seeking behaviour

Percentage of women age 15-49 who have ever experienced physical or sexual violence by whether they have ever sought help, and among those who have sought help from any source, the source from which help was sought, according to the type of violence experienced and marital status, Manipur, 2005-06

| Source | Type of violence experienced |  |  | Marital status |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Physical only | Sexual only | Both physical and sexual | $\begin{gathered} \text { Ever } \\ \text { married } \end{gathered}$ | Never married |  |
| Help seeking behaviour |  |  |  |  |  |  |
| Never sought help and never told anyone | 68.6 | 77.4 | 55.5 | 68.3 | 58.7 | 66.4 |
| Never sought help but told someone | 14.6 | 2.0 | 14.9 | 12.5 | 19.6 | 13.9 |
| Sought help | 14.4 | 17.7 | 27.7 | 16.5 | 20.8 | 17.3 |
| Don't know/missing | 2.4 | 2.8 | 1.9 | 2.7 | 0.9 | 2.3 |
| Number of women who experienced violence | 843 | 63 | 232 | 913 | 224 | 1,137 |
| Sources of help among those who sought any help |  |  |  |  |  |  |
| Own family | 58.4 | * | 41.9 | 44.5 | (76.8) | 52.1 |
| Husband's family | 23.5 | * | 44.3 | 37.9 | (0.0) | 29.0 |
| Husband/last husband | 0.4 | * | 0.0 | 0.3 | (0.0) | 0.2 |
| Current/former boyfriend | 1.6 | * | 0.0 | 0.0 | (4.1) | 1.0 |
| Friend | 12.9 | * | 25.0 | 19.4 | (20.8) | 19.7 |
| Neighbour | 8.2 | * | 14.3 | 12.2 | (1.7) | 9.7 |
| Religious leader | 1.3 | * | 0.0 | 1.1 | (0.0) | 0.8 |
| Police | 0.0 | * | 0.8 | 0.3 | (0.0) | 0.2 |
| Social service organization | 2.0 | * | 2.7 | 2.2 | (1.7) | 2.1 |
| Other | 3.7 | * | 2.7 | 4.1 | (0.0) | 3.1 |
| Number of women who sought help | 122 | 11 | 64 | 150 | 47 | 197 |

[^7]
## APPENDIX A

## ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) nonsampling errors and (2) sampling errors. Nonsampling errors are the result of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the third National Family Health Survey (NFHS-3) to minimize this type of error, nonsampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-3 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-3 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-3 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, $r=y / x$, where $y$ represents the total sample value for variable $y$, and $x$ represents the total number of cases in the group or subgroup under consideration. The variance of $r$ is computed using the formula given below, with the standard error being the square root of the variance:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1-f}{x^{2}} \sum_{h=1}^{H}\left[\frac{m_{h}}{m_{h}-1}\left(\sum_{i=1}^{m_{h}} z_{h i}^{2}-\frac{z_{h}^{2}}{m_{h}}\right)\right]
$$

in which

$$
z_{h i}=y_{h i}-r x_{h i}, \text { and } z_{h}=y_{h}-r x_{h}
$$

where $h \quad$ represents the stratum, which varies from 1 to $H$, $m_{h} \quad$ is the total number of clusters selected in the $h^{\text {th }}$ stratum, $y_{h i} \quad$ is the sum of the weighted values of variable $y$ in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum, $x_{h i} \quad$ is the sum of the weighted number of cases in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum, and $f \quad$ is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudoindependent replications are thus created. In the NFHS-3 sample for Manipur, there were 155 clusters. Hence, 155 replications were created. The variance of a rate $r$ is calculated as follows:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1}{k(k-1)} \sum_{i=1}^{k}\left(r_{i}-r\right)^{2}
$$

in which

$$
r_{i}=k r-(k-1) r_{(i)}
$$

where $r$ is the estimate computed from the full sample of 155 clusters,
$r_{(i)}$ is the estimate computed from the reduced sample of 154 clusters $\left(i^{\text {th }}\right.$ cluster excluded), and
$k \quad$ is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ) for each estimate are also computed.

Sampling errors for NFHS-3 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Manipur as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, ratio, or percentage) and the base population are given in Table A.1. Table A. 2 presents the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ) for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1 ). In the case of the total fertility rate, the number of unweighted cases is not relevant, as there is no known unweighted value for womanyears of exposure to childbearing.

Table A. 1 List of variables for sampling errors, Manipur, 2005-06
Variable $\quad$ Estimate

| Sex ratio (females per 1,000 males) | Ratio |
| :--- | :--- |
| No education | Proportion |

Tuberculosis prevalence
Using adequately iodized salt
Urban residence
No education
Completed 10 or more years of education
Never married, including married gauna not performed Currently married
Married before age 18
Married before age 21
Currently using any method
Currently using a modern method
Currently using a traditional method
Currently using female sterilization
Currently using pill
Currently using IUD
Currently using condom
Using public medical sector source of contraception Want no more children
Want to delay next birth at least 2 years Ideal number of children
Mother received ANC from health personnel Took iron and folic acid (IFA) for 90 days or more Births delivered by a skilled provider Institutional delivery
Postnatal check for mother within 2 days of birth Treated with ORS packets
Children with diarrhoea taken to a health provider Child's vaccination card seen by interviewer Child received BCG vaccination Child received DPT vaccination (3 doses) Child received polio vaccination (3 doses) Child received measles vaccination Child fully vaccinated
Given vitamin A supplement in last 6 months Ever experienced physical or sexual violence Weight-for-height, wasting (below -2SD) Height-for-age, stunting (below -2SD)
Weight-for-age, underweight (below -2SD)
Body mass index $(\mathrm{BMI})<18.5 \mathrm{~kg} / \mathrm{m}^{2}$
Body mass index $(\mathrm{BMI}) \geq 25.0 \mathrm{kgm}^{2}$
Have heard of AIDS
Have comprehensive knowledge about HIV/AIDS
