## Introduction

The 2015-16 National Family Health Survey (NFHS-4), the fourth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. For the first time, NFHS-4 provides district-level estimates for many important indicators. All four NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-4 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation (BMGF), UNICEF, UNFPA, the MacArthur Foundation, and the Government of India. Technical assistance for NFHS-4 was provided by ICF, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires - household, woman's, man's, and biomarker-were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-4. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, and treatment of childhood illnesses, was fielded in the entire sample of NFHS-4 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-4 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV / AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, haemoglobin, blood pressure, and random blood glucose for women age 15-49 years and men age 15-54 years, and the collection of finger-stick blood for HIV testing in a laboratory. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-4 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 640 districts in India, as of the 2011 Census). The total sample size of approximately 572,000 households for India was based on the size needed to produce reliable indicator estimates for each district and for urban and rural areas in districts in which the urban population accounted for $30-70$ percent of the total district population. The rural sample was selected
through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

The figures of NFHS-4 and earlier rounds may not be strictly comparable due to differences in sample size and NFHS-4 will be a benchmark for future surveys. NFHS-4 fieldwork for Maharashtra was conducted in all 35 districts of the state from 1 April to 25 September 2015 by GFK Mode Private Limited and collected information from 26,890 households, 29,460 women age 15-49 (including 4,707 women interviewed in PSUs in the state module), and 4,811 men age 15-54. Survey response rates were 96 percent for households, 94 percent for women, and 89 percent for men.

This report presents the key findings of the NFHS-4 survey in Maharashtra, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

## Household Characteristics

## Household composition

Almost half (49\%) of households in Maharashtra are located in urban areas. On average, households in Maharashtra are comprised of 4.5 members. Thirteen percent of households are headed by women, with 10 percent of the population living in female-headed households.

Seventy-nine percent of households in Maharashtra have household heads who are Hindu. Eleven percent of households have household heads who are Muslim and 9 percent have Buddhist/Neo-Buddhist household heads.

Seventeen percent of households in Maharashtra have household heads who belong to a scheduled caste, 11 percent belong to a scheduled tribe, 27 percent belong to an other backward class (OBC), and 44 percent belong to none of these groups. A majority of households (56\%) have a nuclear family structure.

One-fourth of Maharashtra's population is under age 15; only 8 percent is age 65 and over. The overall sex ratio of the population is 952 females per 1,000 males, and the sex ratio of the population under seven years of age is low ( 918 females per 1,000 males). Eighty-one percent of persons have an Aadhaar card.

Among children below 18 years of age, 5 percent have experienced the death of one or both parents. In all, 90 percent of children below 18 years of age live with both parents, 7 percent live with one parent (mostly with their mother), and the remaining 3 percent live with neither parent. Births of almost all children under 5 years of age ( $95 \%$ ) have had their birth registered with the civil authorities, and 75 percent have a birth certificate.

## Housing characteristics

Almost three-fourths (73\%) of households in Maharashtra live in a pucca house and more than nine out of every 10 households ( $93 \%$ ) are connected to electricity. Twenty-nine percent of households do not use a sanitation facility, which means that household members practice open defecation. The percentage of such households is much higher in rural Maharashtra (50\%).

Less than two-thirds (63\%) of households in Maharashtra have water piped into their dwelling, yard, or plot.

Ninety-two percent of households use an improved source of drinking water, but only 63 percent have water piped into their dwelling, yard, or plot. Urban households ( $82 \%$ ) are far more likely than rural households $(44 \%)$ to have water piped into their dwelling, yard, or plot. Only 33 percent of households treat their drinking water appropriately to make it potable. A majority of households ( $60 \%$ ) in Maharashtra use a clean fuel for cooking.

## Selected household possessions

Ninety-seven percent of urban and 86 percent of rural households in Maharashtra have a mobile phone. Eighty-nine percent of households have a bank or post office account. Forty percent of households possess either a motorcycle or a scooter. BPL cards are held by 27 percent of households. Agricultural land is owned by 55 percent of rural households and 15 percent of urban households. Overall, 35 percent of all households in Maharashtra own some agricultural land, mostly non-irrigated land.

## EdUCATION

## School attendance among children

Eighty-eight percent of children age 6-17 years in Maharashtra attend school ( $89 \%$ in urban areas and $87 \%$ in rural areas). School attendance is 95 percent at age 614 years, and then drops sharply to 74 percent at age 15-17 years. There is almost no gender disparity in school attendance in the 6-14 year age group; however, in the age group 15-17 years, 71 percent of girls compared with 76 percent of boys are attending school.

Are there gender differentials in children's school attendance?
Percentage of children attending school by age

## Literacy, educational attainment, and media exposure

In NFHS-4, literate persons are those who have either completed at least standard six or passed a simple literacy test conducted as part of the survey. According to this measure, 80 percent of women age 15-49 and 93 percent of men age 15-49 are literate.

Only one-fourth of women age 15-49 in Maharashtra have completed 12 or more years of schooling, compared with 34 percent of men.

Fifteen percent of women and 6 percent of men age 15-49 have never been to school. Only 25 percent of women age 15-49 in Maharashtra have completed 12 or more years of schooling, compared with 34 percent of men.

Media exposure is high among women and men in Maharashtra. More than 8 in 10 women and men watch television at least once a week. However, men ( $62 \%$ ) are much more likely than women $(35 \%)$ to read a newspaper or magazine at least once a week. Eight percent of men and 15 percent of women are not regularly exposed to print media or other forms of media.

## Fertility

## Age at first marriage

In Maharashtra, the median age at first marriage is 19.9 years among women age $25-29$ years and 19.3 years among women age $20-49$ years. Only 10 percent of women age 20-49 years have never married, compared with 28 percent of men age 20-49. Just over one-fourth of women age 20-24 years got married before the legal minimum age of 18 years, down from 39 percent in NFHS-3. Thirty-four percent of women age 20-24 years are never married, compared with 83 percent of men in the same age group, showing that the age at marriage is much lower for women than men in Maharashtra.

## Fertility levels

The total fertility rate (TFR) in Maharashtra is 1.9 children per woman which is below replacement level fertility. Fertility has decreased by 0.2 children in the 10 years between NFHS-3 and NFHS-4.

Fertility in urban areas, at 1.7 children per woman, is below replacement level and in rural areas, it is 2.1 children per woman, or exactly at replacement level. Among births in the three years preceding the survey, 6 percent were of birth order four or higher, compared with

## Fertility Trends

Total fertility rate
(children per woman)
 12 percent in NFHS-3.

The greatest differentials in fertility are by religion, caste/tribe, and schooling. At current fertility rates, women with no schooling have 1 child more than women who had 12 or more years of schooling. Similarly, Muslim women will have an average of 0.5 children more than Hindu women (a TFR of 2.3, compared with 1.8) and Buddhist/Neo-Buddhist women (1.7).

## How does fertility vary with schooling? Total fertility rate (children per woman)

## Pregnancy outcome

Ninety-one percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 9 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Miscarriage is the most commonly reported type of foetal wastage, accounting for 5 percent of all pregnancies, and abortions accounted for 4 percent. A large majority (76\%) of the abortions were performed in the private health sector and 20 percent were performed in the public health sector. Sixteen percent of women reporting an abortion reported having complications from the abortion. Most of the induced abortions in Maharashtra ( $88 \%$ ) are performed by a doctor.

## Teenage pregnancy

Among young women age 15-19 in Maharashtra, 8 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, down from 14 percent in NFHS-3. The proportion of women who have started childbearing rises sharply from 5 percent at age 17 years to 13 percent among women age 18 years and to 21 percent among women age 19 years. The proportion who have started childbearing is much higher among young women who had no schooling ( $24 \%$ ) than those with 12 or more years of schooling (3\%).

## Birth intervals

The median interval between births in the five years before the survey in Maharashtra is 31.8 months. Ten percent of births take place within 18 months of the previous birth and 26 percent occur within 24 months. The proportion of births occurring within 24 months of a previous birth is particularly high for mothers in the 20-29 age group (31\%) and for births occurring after a deceased sibling ( $58 \%$ ). Almost three-fifths ( $59 \%$ ) of all births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality.

# Almost three-fifths (59\%) of births in Maharashtra occur within three years of the previous birth. 

## Fertility preferences

Seventy-three percent of currently married women and men age 15-49 years want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, 38 percent of women and 39 percent of men would like to wait at least two years before the next birth. Eighty-seven percent of women and 85 percent of men consider the ideal family size to be two or fewer children.

In Maharashtra, there is a strong preference for sons. Eleven percent of women and 15 percent of men want more sons than daughters, but only 4-5 percent of women and men want more daughters than sons. However, a majority of men and women would like to have at least one son and at least one daughter.

Women's desire for more children is strongly affected by their current number of sons. For example, among women with two children, 94 percent with two sons and 92 percent with one son want no more children, compared with 68 percent with two daughters who want no more children. Notably, however, the proportion of currently married women with two children who want no more children irrespective of their number of sons has remained almost unchanged ( $88-90 \%$ ) in the 10 years since NFHS-3, but for men with two children, the proportion who want no more children has increased from 63 percent to 90 percent.

## How does son preference affect women's desire for children? <br> Percentage of currently married women with two children who want no more children

NFHS-1 $\quad$ NFHS-2 $\quad$ NFHS-3 $\quad$ NFHS-4

Current family size

In Maharashtra, unplanned pregnancies are moderately common. If all women were to have only the number of children they wanted, the total fertility rate would have been 1.6 children per woman, instead of the current level of 1.9 children per woman.

## Family Planning

## Contraceptive knowledge and use

Knowledge of contraception is almost universal in Maharashtra. However, some methods are still less well known. Only 10 percent of currently married women know about the lactational amenorrhoea method (LAM) and 31 percent know about female condoms. Among all women, only 41 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 65 percent, only a slight decrease from NFHS-3 (67\%). The use of modern family planning methods (63\%) has also slightly declined from its level in NFHS-3 ( $65 \%$ ). The level of female sterilization use has remained unchanged, at 51 percent, in Maharashtra between NFHS-3 and NFHS-4; the share of female sterilization in overall contraceptive use has fluctuated between 74 and 80 percent in all four NFHS surveys. Contraceptive use in NFHS-4 increases sharply with age, from 11 percent for women age 15-19

How many women use family planning?
Percentage of currently married women
 to 80 percent for women age 40-49.

In Maharashtra, contraceptive use shows little difference in rural and urban areas. Contraceptive prevalence decreases with increasing schooling of women; more than 7 in 10 currently married women with no schooling use female sterilization, compared with only 28 percent of women with 12 or more years of schooling. Muslim women (59\%) are less likely to use contraception than either Hindu (65\%) or Buddhist or Neo-Buddhist women (69\%).

Women in Maharashtra are much more likely to use contraception if they already have a son. For example, among women with two children, 80 percent with at least one son use a method of family planning, compared with 55 percent of women with two daughters and no sons.

What contraceptive methods do women use? Currently married women

The most common modern spacing methods used by currently married women in Maharashtra are condoms (7\%), followed by the pill (2\%) and IUD or PPIUD (2\%). In general, urban women and better-educated women are more likely than other women to use spacing methods.

Eighty percent of sterilized women had their sterilization operation in the public sector, mainly in a government or municipal hospital, and 62 percent of IUD or PPIUD users had their IUD insertion in the private sector.

The majority of pill and condom/Nirodh users get their supply from the private health sector or other source, including a shop. Nonetheless, 24 percent of pill users and 21 percent of condom/Nirodh users get their supply from the public sector.

The 12-month discontinuation rate for any reason is 24 percent for all methods. Thirty-nine percent of users of modern spacing methods discontinued use within the first year after they adopted the method. The most common reason for discontinuation is the desire to become pregnant.

## Thirty-nine percent of users of modern spacing methods discontinued use within the first year after they adopted the method.

## Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Only 45 percent of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use. Only 36 percent were told about the possible side effects or problems with their method, and even fewer $(30 \%)$ were told what to do if they experienced any side effects.

## Men's attitudes

Almost one-fourth of men age 15-49 in Maharashtra ( $23 \%$ ) agree that contraception is women's business and a man should not have to worry about it. However, only 11 percent of men think that women using contraception may become promiscuous. A majority of men (58\%) know that a condom, if used correctly, protects against pregnancy most of the time.

## Contraceptive Prevalence Rate by District <br> Percentage of currently married women

## Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 10 percent of currently married women have an unmet need for family planning, unchanged since NFHS-3. Currently, 87 percent of the demand for family planning is being satisfied and 84 percent of the demand is being satisfied by modern methods.

## Infant and Child Mortality

The infant mortality rate in Maharashtra in NFHS-4 is estimated at 24 deaths before the age of one year per 1,000 live births, down from the NFHS-3 estimate of 38, the NFHS-2 estimate of 44, and the NFHS-1 estimate of 51.

Trends in Infant Mortality Deaths per 1,000 live births

As expected, boys have a higher mortality rate than girls, especially during the neonatal period (in the first month of life) and between ages 1 and 5 years. Not much difference is observed in mortality rates of girls and boys during the postneonatal period (ages 1-11 months).

High-risk births have higher mortality rates Deaths in the first year of life per 1,000 live births

Note: Category "Mother's age at birth 40-49" not shown since there are fewer than 250 unweighted person-years of exposure to the risk of death

Children born to mothers under age 20 and age 30-39 are more likely to die during infancy than children born to mothers in the prime childbearing age (20-29 years). Infant mortality is 38 per 1,000 live births for teenage mothers and 29 per 1,000 live births for mothers age 30-39, compared with 20 per 1,000 live births for mothers age 20-29.

Infant mortality rates are also slightly higher for Muslims than for Hindus and are higher for scheduled tribes and scheduled castes than for those who are not from scheduled castes, scheduled tribes, or other backward classes.

The infant mortality rate is almost identical in rural and urban areas, but child mortality is slightly higher in rural areas than urban areas. The infant mortality rate is lowest for children whose mothers have no schooling and highest for those whose mothers have less than 10 years of schooling.

# Children born to the teenage mothers are more likely to die during infancy than mothers age 20-29. 

## Maternal Health

## Antenatal care

Among mothers who gave birth in the five years preceding the survey, more than 9 in 10 received antenatal care for their last birth from a health professional (78\% from a doctor and $14 \%$ from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Eight percent did not receive any antenatal care (ANC). Among mothers who gave birth in the five years preceding the survey, 93 percent registered the pregnancy for the most recent live birth. Among the registered pregnancies, 91 percent received a Mother and Child Protection Card (MCP Card).

Just over two-thirds (68\%) of women received antenatal care during the first trimester of pregnancy, as is recommended. Seventy-two percent of mothers had four or more antenatal care visits; urban women were more likely to receive four or more antenatal visits than rural women. The proportion of women who

Four or More Antenatal Care Visits by District Percentage of last births in the past five years
 antenatal care visit in the first trimester of pregnancy for their last births have both increased substantially in the 10 years since NFHS-3. For 85 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 41 percent consumed them for the recommended 100 days or more. Ninety percent of last births were protected against neonatal
tetanus through tetanus toxoid vaccinations given to the mother. Twenty-seven percent of mothers took an intestinal parasite drug during pregnancy.

## Seventy-two percent of mothers in Maharashtra received at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, at least 7 in 10 received advice on each of five different areas $(87 \%$ received advice on breastfeeding, $82 \%$ on keeping the baby warm, $81 \%$ on cord care, $79 \%$ on family planning and $72 \%$ on the importance of institutional delivery).

> How does appropriate antenatal care vary with schooling?
> Percentage of last births in the past five years

Even when women receive antenatal care, sometimes they do not receive all the services needed to monitor their pregnancy. In Maharashtra, more than 97 percent of women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their weight taken, their blood pressure measured and urine samples taken ( $98 \%$ each), and having blood samples taken and having their abdomen examined ( $97 \%$ each).

An ultrasound test was performed during 83 percent of pregnancies in the five years preceding the survey. Women with at least 12 years of schooling were much more likely to have an ultrasound test than women with no schooling. Ninety-two percent of women with at least 12 years of schooling had an ultrasound test compared with 55 percent of women with no schooling. Pregnant women with no sons are much more likely to have an ultrasound test than
those with at least one son. For example, among women with two children, those with no sons ( $80 \%$ ) were much more likely to have an ultrasound test during their next pregnancy than those who had at least one son ( $64 \%$ ).

## Delivery care

Nine in 10 births (90\%) take place in a health facility (mostly a government facility) and 10 percent take place at home. The percentage of births in a health facility increased sharply in the 10 years between NFHS-3 and NFHS-4, from 65 percent in NFHS-3 to 90 percent in NFHS-4. Institutional births are more common among women who have received an antenatal check, women with 12 or more years of schooling, women who are having their first birth, and urban women.

For 94 percent of home births, a clean blade was used to cut the cord, as is recommended. A disposable delivery kit was used for 44 percent of deliveries. Eighty-five percent of home births followed the recommendation that the baby be
 immediately wiped dry and then wrapped without being bathed first.

Ninety-one percent of births during the past five years took place with assistance from a skilled provider, and another 4 percent were delivered by a traditional birth attendant.

Twenty percent of births during the past five years were delivered by caesarean section. Almost two-fifths ( $41 \%$ ) of caesarean sections ( $8 \%$ of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 9 percent received financial assistance under the Janani Suraksha Yojana (JSY). Rural women were more likely than urban women to receive financial assistance under JSY. Scheduled caste and scheduled tribe women were more likely than any other caste/tribe group of women to receive financial assistance under JSY.

Institutional Delivery by District
Percentage of births in the past five years

Ninety percent of children in Maharashtra who were born in the past five years were born in a health facility.

## Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Maharashtra, 82 percent of mothers had a postnatal check after their last birth and 80 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common following births in a health facility; 81 percent of births in public health facilities and 86 percent of births in private health facilities were followed by a postnatal check for the mother within two days of birth, compared with 41 percent of home births.

Only 32 percent of last births in the five years preceding the survey received a health check in the first two days after birth. Twenty-eight percent of home births received a health check in the first two days after birth.

## Male involvement in maternal care

Ninety-two percent of men with a child under three years of age said that the youngest child's mother received antenatal care. Four-fifths of men with a child under three years said they were present during at least one antenatal check received by the child's mother ( $84 \%$ in urban areas and $79 \%$ in rural areas), but only 59 percent were told by a health provider or health worker what to do if the mother had a pregnancy complication. Only 33-56 percent of men were told about the signs of specific pregnancy complications (convulsions, vaginal bleeding, prolonged labour, high blood pressure, and severe abdominal pain).

Most fathers with a child less than three years of age were given information about various aspects of maternal care. Eighty-four percent were told about the importance of proper nutrition for the mother during pregnancy and 73 percent were told about the importance of delivering the baby in a health facility. Seventy-one percent were told by a health provider or a health worker about family planning or delaying the next child. Only 35-42 percent of fathers whose child was not delivered in a health facility were told about the importance of cord care, the importance of keeping the baby warm immediately after birth, and the importance of breastfeeding the baby immediately after delivery.

## Child Health

## Vaccination of children

More than half ( $56 \%$ ) of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, most children are at least partially vaccinated; only 8 percent have not received any vaccinations at all.

$\square$ NFHS-1 $\quad$ NFHS-2 $\quad$ NFHS-3 $\quad$ NFHS-4

Ninety percent of children have received a BCG vaccination. However, only about threefourths have received other basic vaccinations ( $67 \%$ have received at least the recommended three doses of polio vaccine, $75 \%$ have received the three recommended doses of DPT vaccine, and $83 \%$ have been vaccinated against measles). There is considerable dropout between the first and third doses of DPT vaccine (from $86 \%$ to $75 \%$ ) and polio vaccine (from $89 \%$ to $67 \%$ ).

Between NFHS-3 and NFHS-4, there was a slight decline in vaccination coverage for three doses of DPT (from $76 \%$ to $75 \%$ ) and measles (from $85 \%$ to $83 \%$ ), and a larger decline for BCG (from $95 \%$ to $90 \%$ ). The coverage for three doses of polio vaccine also declined, from 73 percent to 67 percent. Overall, there was a small decrease in the coverage of all basic vaccinations (from $59 \%$ to $56 \%$ ). In addition, over four-fifths (85\%) of children have received at least one dose of hepatitis $B$ vaccine, but just over three-fifths (61\%) of children have received all three recommended doses of hepatitis $B$ vaccine.

Coverage with all basic vaccinations is slightly higher for girls than boys (58\% versus 55\%) and increases steadily with the schooling of the mother. Coverage with all basic

Coverage of All Basic Vaccinations by District Percentage of children 12-23 months
 vaccinations is higher among children in other backward classes ( $64 \%$ ) than children in other castes/tribes. There is not much difference in vaccination coverage in rural and urban areas. Children of birth orders $4-5(40 \%)$, children whose mothers have no schooling ( $43 \%$ ), and Muslim children ( $46 \%$ ) have the lowest vaccination coverage of any other group in the table.

## Childhood illnesses

In the two weeks before the survey, 2 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related). Of these children, 89 percent were taken to a health facility or health provider.

Thirteen percent of children under age five were reported to have had fever in the two weeks preceding the survey; 85 percent of these children were taken to a health facility or provider for treatment.

Overall, 9 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Seventy-eight percent of these children were taken to a health facility or health provider. Almost 9 out of 10 mothers of young children ( $88 \%$ ) have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 61 percent of children with diarrhoea were given ORS. Fifty-three percent of children with diarrhoea were given gruel and more than three-fourths ( $77 \%$ ) were given any type of oral rehydration therapy (ORT). Thirteen percent were given zinc supplements. Twelve percent of children with diarrhoea did not receive any type of treatment at all.

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Maharashtra only 13 percent of children with diarrhoea received more to drink than normal. Only about one-fourths (26\%) of children received the same amount to drink as usual. Of greater concern, three-fifths of children with diarrhoea were given less to drink or nothing at all to drink. Only one-third of children with diarrhoea were given the same amount of food or more food, as recommended. Slightly more than half (54\%) of children with diarrhoea were given ORT or increased fluids and continued feeding.

## Integrated Child Development Services (ICDS)

The ICDS programme pro-vides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based anganwadi centres.

Forty-nine percent of children under 6 years receive services of some kind from an anganwadi centre. The most common services that ageeligible children receive are supplementary food (48\%), growth monitoring (46\%), early childhood care or preschool (46\%), and health check-ups ( $44 \%$ ). The service that is least likely to be accessed is immunizations (38\%). More than half (58\%) of the mothers of children who were weighed at an anganwadi

How many children received anganwadi centre services? Percentage of age-eligible children receiving services
 centre received counselling from an anganwadi worker or an ANM. Among children under 6 years, slightly more than twofifths $(44 \%)$ of their mothers received any service from an anganwadi centre during pregnancy, and two fifths ( $40 \%$ ) of their mothers received any service while breastfeeding.

## Breastreeding, Nutrition, and Anaemia

## Infant feeding

Although breastfeeding is nearly universal in Maharashtra, only 57 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Eighty-seven percent are put to the breast within the first day of life, but only 57 percent started breastfeeding in the first hour of life (as recommended). While the initiation of breastfeeding indicators shows an improvement since NFHS-3, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, 13 percent of children are given something other than breastmilk during the first three days. Overall, 85 percent of children continue breastfeeding at 1 year and almost two-thirds (64\%) continue breastfeeding at 2 years. The median duration of breastfeeding is 25.4 months, which is the age to which half of children are breastfed.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. However, at age 6-8 months, only 43 percent of children in Maharashtra receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and nonbreastfed children. Over one-fourth (29\%) of children age 6-23 months are fed the recommended minimum number of times per day and even fewer ( $22 \%$ ) are fed from the appropriate number of food groups. Only 7 percent are fed according to all three recommended practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Maharashtra, more than two-thirds ( $71 \%$ ) of children age 9-59 months were given a vitamin A supplement in the past six months, but only 45 percent of children age 9-23 months ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Seventeen percent of children age 9-23 months ate iron-rich foods during the day or night before the survey; however, 41 percent of children age 6-59 months were given iron supplements in the week before the survey.

## Children's nutritional status

Thirty-four percent of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Twenty-six percent are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 9 percent are severely wasted. Thirty-six percent are underweight, which takes into account both chronic and acute undernutrition. Even during the first six months of life when almost all babies are breastfed, 19 percent of children are stunted, 40 percent are wasted, and 23 percent are underweight.

Children's nutritional status in Maharashtra has improved since NFHS-3 by some measures, but not by all measures. Stunting decreased from 46 percent to 34 percent in the 10 years between NFHS-3 and NFHS-4, and the percentage of children who are underweight decreased marginally from 37 percent to 36 percent. However, in the same period, wasting increased from 17 percent to 26 percent. Despite the gains in stunting and underweight, child malnutrition is still a major problem in Maharashtra.

There are only small differences in the level of undernutrition by the sex of the child. However, differences are more pronounced for urban-rural residence and other background characteristics. Undernutrition generally decreases with increasing mother's schooling, better nutritional status of the mother, and larger child's size at birth. The level of undernutrition is relatively high for rural children and children of higher birth orders. It is generally lower among Muslim children than among children of other religions.

## Adults' nutritional status

More than two-fifths ( $47 \%$ ) of women and 43 percent of men are either too thin or overweight or obese. Among women age 15-49, the proportion overweight or obese is 23 percent, which is considerably higher than a decade ago ( $15 \%$ in NFHS-3). More men are overweight or obese $(24 \%)$ than thin ( $19 \%$ ), which is the opposite of the pattern observed in NFHS-3. Twenty-four percent of women and 19 percent of men in Maharashtra are too thin, and 23 percent of women and 24 percent of men are overweight or obese. Over half of women and men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups, in rural areas, and among scheduled tribes. Overweight and obesity are most prevalent in older adults, those in urban areas, and well-educated men as well as women.

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Ninety-six percent of Maharashtra's households were using iodized salt at the time of the survey, a considerably higher proportion (74\%) than reported in NFHS-3.

## Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworm and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Maharashtra, especially among women and children.

Among children between the ages of 6 and 59 months, a majority ( $54 \%$ ) are anaemic. This includes 28 percent who are mildly anaemic, 25 percent who are moderately anaemic, and 1 percent who suffer from severe anaemia. There is no difference in the prevalence of anaemia among girls and boys. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. Almost half (49\%) of children in Maharashtra are anaemic even if their mother has 12 or more years of schooling.

Anaemia among women, men, and children

## $\square$ Mild anaemia $\quad$ Moderate anaemia $\quad$ Severe anaemia

Forty-eight percent of women in Maharashtra have anaemia, including 37 percent with mild anaemia, 10 percent with moderate anaemia, and 1 percent with severe anaemia. Anaemia is particularly high for scheduled tribe women, but anaemia exceeds 43 percent for every group of women. Anaemia among women has increased by 4 percentage points since NFHS-3. Almost one-fifth ( $18 \%$ ) of men are anaemic. Men under age 20 are particularly likely to be anaemic.

## Adult Health and Health Care

## Tuberculosis

In Maharashtra, 238 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is higher among men (261) than among women (214) and is higher in urban areas (276) than in rural areas (205).

A large majority of respondents have heard of tuberculosis ( $82 \%$ of women and $90 \%$ of men), but even among those who have heard of tuberculosis, only 82 percent of women and 87 percent of men know that it is spread through the air by coughing or sneezing. Over one-third ( $34 \%$ ) of women and 36 percent of men have misconceptions about how tuberculosis is spread. Overall, 91 percent of women and 93 percent of men know that tuberculosis can be cured, and only 18 percent of women and 17 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

## Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 1,437 women age 15-49 and 1,087 men age 15-49 per 100,000 have diabetes. Overall, 1,862 women and 1,189 men per 100,000 suffer from asthma. The prevalence of asthma among women is higher among older age groups, those who have less schooling,
of asthma among women is higher among older age groups, those who have less schooling, and those rural areas. Goitre is almost as common as asthma among women, but less common than asthma among men (1,756 per 100,000 women and 261 per 100,000 men). The prevalence of any heart disease is higher among women ( 633 per 100,000) than among men ( 463 per 100,000 ). Among the five diseases, cancer is the least common, with 95 women per 100,000 and 96 men per 100,000 reportedly suffering from cancer.

## Blood pressure (hypertension)

Twelve percent of women age 15-49 in Maharashtra have hypertension, including 7 percent with Stage 1 hypertension, and 1 percent each with Stage 2 and Stage 3 hypertension. Sixtyfour percent of women have normal blood pressure including, 1 percent of women with normal blood pressure who are taking medicine to lower their blood pressure. The prevalence of hypertension among men age 15-49 is somewhat higher than in women. Eighteen percent of men in Maharashtra have hypertension, including 12 percent with Stage 1 hypertension, 4 percent with Stage 2 hypertension, and 1 percent with Stage 3 hypertension. Forty-three percent of men have normal blood pressure, including 1 percent of women with normal blood pressure who are taking medicine to lower their blood pressure. For both women and men, hypertension tends to increase with age.

## Blood glucose

NFHS-4 included measurement of random blood glucose among women age 15-49 and men age 15-54. Three percent of women age 15-49 in Maharashtra have high blood glucose levels, and 2 percent have very high blood glucose levels. In comparison, 3 percent each of men age 15-49 have high and very high blood glucose levels. Older women and men, and women with no schooling have relatively high blood glucose levels.

## Health examinations

In Maharashtra, 43 percent of women have ever an undergone an examination of the cervix, 22 percent have ever undergone a breast examination, and 16 percent have ever undergone an examination of the oral cavity.

## Tobacco and alcohol use

Over one-third ( $37 \%$ ) of men, but only 6 percent of women, age $15-49$ use some form of tobacco. Men are much more likely to use gutkha or paan masala with tobacco (12\%), to use khaini $(11 \%)$ and to smoke cigarettes $(9 \%)$ than to use other types of tobacco. Among women and men, the use of any form of tobacco is slightly higher in rural areas than in urban areas. Most men who smoke cigarettes or bidis smoked only two or fewer cigarettes or bidis in the past 24 hours. Men are less likely to drink alcohol ( $21 \%$ ) than to use tobacco, and almost no women say that they drink alcohol. Among men who drink alcohol, almost half (46\%) drink alcohol at least once a week.

## Source of health care

The private health sector is the main source of health care for almost two-thirds of urban and 60 percent of rural households. Household members are slightly more likely to go to private hospitals (38\%) than private doctors or clinics ( $25 \%$ ).

## Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, only 15 percent of households in Maharashtra have any kind of health insurance that covers at least one member of the household. Health insurance coverage is somewhat more common in urban areas ( $16 \%$ ) than in rural areas ( $14 \%$ ). In Maharashtra, three types of programmes dominate: the Rashtriya Swasthya Bima Yojana (RSBY), the Central Government Health Scheme (CGHS), and the State health insurance scheme.

Only 8 percent of women and 13 percent of men age 15-49 years in Maharashtra are covered by any health scheme or health insurance. Older women and men are more likely to be covered by any health scheme or health insurance than younger women/men. Health scheme or health insurance coverage is higher among women and men with 12 or more years of schooling than among those with less or no schooling.

## HIVIAIDS

## Awareness of HIV or AIDS

Eighty-seven percent of women in Maharashtra have heard of HIV or AIDS. In urban areas, 92 percent know about HIV or AIDS, compared with 81 percent in rural areas. Young women age 15-24 years are slightly more likely ( $88 \%$ ) than older women age $40-49(84 \%)$ to have heard of HIV or AIDS. Women having no schooling (64\%), women not having regular exposure to media ( $67 \%$ ), and women from scheduled tribes ( $74 \%$ ) are less likely than other women to have heard of HIV or AIDS.

Men are more likely than women to know about HIV or AIDS. Over nine-tenths (94\%) of men in Maharashtra have heard of HIV or AIDS, including 96 percent in urban areas.

## Knowledge of prevention and transmission

Men are much more likely than women to know how HIV/AIDS is transmitted and how to keep from getting it. For example, only 68 percent of women know that consistent condom use can help prevent HIV / AIDS, compared with 86 percent of men, and almost seven-tenths (69\%) of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/ AIDS, compared with 82 percent of men.

Only 30 percent of women and 44 percent of men in Maharashtra have a 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthylooking person can have HIV/AIDS, and they reject two common misconceptions about transmission or prevention of HIV/ AIDS.

Do people know how to prevent HIVIAIDS? Percentage of women and men age 15-49

## HIV-related stigma

Over four-fifths ( $81 \%$ ) of women and 85 percent of men in Maharashtra would be willing to take care of a relative with HIV/AIDS in their home. A similar proportion of women ( $84 \%$ ) and men $(87 \%)$ say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Over seven-tenths ( $72 \%$ ) of women and 80 percent of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Fifty-four percent of women and 57 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

## HIV testing prior to NFHS-4, blood transfusions, and safe injections

Only 27 percent of women and 13 percent of men age 15-49 had ever been tested for HIV prior to NFHS-4. Women and men living in urban areas are somewhat more likely to have ever been tested for HIV prior to NFHS-4 than rural women and men. Almost two-fifths of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Urban women ( $45 \%$ ) are more likely than rural women $(35 \%)$ to have been tested for HIV during ANC.

## Almost two-fifths of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Maharashtra, women (7\%) are slightly more likely than men (5\%) to have ever had a blood transfusion. Women are also more likely than men to have received an injection in the past 12 months ( $61 \%$ of women, compared with $53 \%$ of men). For almost nine-tenths ( $86 \%$ ) of adults who received an injection in the past 12 months, a disposable syringe was used.

## Sexual Behaviour

NFHS-4 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

## Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, only 0.3 percent of women and 8 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months is somewhat higher $(11 \%)$ in urban areas than in rural areas (5\%). Even fewer respondents said that they had multiple sex partners in the past 12 months ( $0.2 \%$ of women and $2 \%$ of men).

More than two-thirds ( $68 \%$ ) of men who had higher-risk sex in the past 12 months reported using a condom the last time they had higher-risk sex. Among men who had higher-risk sex in the past 12 months, the proportion who reported using a condom the last time they had higher-risk intercourse is higher in urban areas ( $71 \%$ ) than in rural areas ( $62 \%$ ). One percent of men said they had paid for sex in the past year.

## Women's Empowerment

## Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-4, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Maharashtra, 50 percent each use sanitary napkins and cloth, 17 percent use locally prepared napkins, and 3 percent use tampons. Overall, 66 percent of women age 15-24 use a hygienic method of menstrual protection. Women with at least 12 years of schooling are more than three times as likely to be using a hygienic method as women with no schooling. Notably, only 56 percent of rural women use a hygienic method of menstrual protection, compared with 77 percent of urban women.

## Employment and earnings

Only 36 percent of all women age 15-49 were employed in the 12 months preceding the survey; in the same period, 83 percent of all men age 15-49 were employed. Among employed women, 81 percent earned cash, including 3 percent whose earnings were in both cash and inkind and 18 percent were not paid at all. Most men who were employed earned cash (92\%) and only 7 percent were not paid at all. Thirty-eight percent of employed women worked in non-agricultural occupations, compared with 69 percent of employed men.

## Only 36 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, 86 percent decide how their earnings will be used, either alone or jointly with their husbands. Nearly half (46\%) of the women who work for cash say that they earn more or about the same as their husbands. By contrast, 76 percent of currently married men who have wives who have cash earnings report that they alone or jointly with their wives decide how her earnings are used and 44 percent of men who have cash earnings and whose wives have cash earnings say that their wife earns more or about the same and as them.

## Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Women are somewhat more likely to participate in decisions about visits to their own family and relatives ( $83 \%$ ) than decisions about their own health care ( $80 \%$ ) or about major household purchases ( $76 \%$ ). Overall, 68 percent of currently married women participate in making all three of these decisions, and 11 percent do not participate in making any of the three decisions. Participation in all three decisions varies most by age, increasing sharply from 53 percent among women age 15-19 to 74 percent among women age 40-49.

Currently married men were also asked who makes decisions about their own health care and major household purchases. Men were much more likely than women to report that they alone or jointly with their wife participated in both these decisions: 91 percent participated in making decisions about their own health care and 87 percent participated in decisions about major household purchases.

## Other indicators of women's empowerment

Fifty-three percent of women have some money that they can decide how to use. The proportion of women with money which they control is higher among urban than rural women, increases sharply with age, and is highest among women with 12 or more years of schooling ( $64 \%$ ) and women who are employed for cash ( $66 \%$ ) than any other group of women.

## Over two-fifths (45\%) of women have a bank or savings account that they themselves use.

Over two-fifths (45\%) of women have a bank or savings account that they themselves use. This percentage is highest, at 76 percent, among women who belong to "other" religions, as well as among women who have 12 or more years of schooling ( $68 \%$ ). Women's knowledge and use of
microcredit programmes is very limited. Thirty-seven percent of women know of a microcredit programme in the area and only 5 percent have ever taken a loan from a microcredit programme.

Only 52 percent of women are allowed to go by themselves to all three of the following places: the market, a health facility, and places outside the village/community. The only groups of women in which more than two-thirds of women ( $68 \%$ ) are allowed to go to all three places alone are women age 40-49 and those who belong to "other" religions.

## Ownership of assets

Thirty-three percent of women and 47 percent of men age 15-49 own a house alone or jointly with someone else, and 23 percent of women and 31 percent of men own land alone or jointly with someone else. Among men, ownership of both a house and land is more common in rural than urban areas, but for women, ownership of a house either alone or jointly is more common in urban than in rural areas.

Thirty-three percent of women own a house alone or jointly with someone else, and 23 percent of women own land alone or jointly with someone else.

Forty-six percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, 79 percent can read SMS messages. Sixty percent of urban women have a mobile phone they themselves use, compared with 31 percent of rural women. Mobile phone access increases dramatically with education and is highest among women of "other" religions ( $82 \%$ ). Only 29 percent of women belonging to a scheduled tribe have a mobile phone they themselves use, compared with more than two-fifths of women in other caste/tribe categories. Scheduled tribe women who have a mobile phone that they themselves use are also less likely to be able to read SMS messages than women in other caste/tribe groups who have a mobile phone that they themselves use.

## Forty-six percent of women have a mobile phone that they themselves use.

## Gender-role attitudes

Forty-nine percent of women believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to believe that wife beating is justified if a woman shows disrespect for her in-laws (37\%), followed by if she neglects the house or children (28\%) and if he suspects her of being unfaithful (24\%). Men are less likely to agree: 37 percent say that wife beating is justified in some circumstances, especially if the wife shows disrespect for in-laws ( $28 \%$ ) or if she neglects the house or children (17\%) and if she argues with him (16\%). Even among women and men who have completed at least 12 years of schooling, 42 percent of
women and 29 percent of men say that a husband is justified in beating his wife for one or more of the specified reasons.

Eighty-two percent of women and 74 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. Most men, 79 percent, do not agree that if a wife refuses to have sex with her husband he has a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

## Domestic Violence

Among women age 15-49, 21 percent have ever experienced physical violence and 3 percent have ever experienced sexual violence. In all, 21 percent of women in Maharashtra have experienced physical or sexual violence. Among those who experienced physical violence since age 15, the most common perpetrator for ever-married women was by far the current husband.

## Over one-fifth (21\%) of women age 15-49 in Maharashtra have experienced physical or sexual violence.

## Violence during pregnancy

Three percent of women who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies. Women with no schooling, women with five or more children and women who are widowed/divorced/separated/deserted, at 6-7 percent, are more likely than women in any other group to have experienced violence during pregnancy.

## Spousal violence

Twenty percent of ever-married women report having been slapped by their husband; 3-7 percent report being pushed, shaken, or having something thrown at them; having their arm twisted or hair pulled; being punched; or being kicked, dragged, or beaten up; and 1 percent have experienced being choked or burned on purpose. Two percent report that their husbands have physically forced them to have sex even when they did not want to and 1 percent report that their husband forced them with threats or other ways to perform sexual acts they did not want to perform. Overall, 21 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Ten percent report spousal emotional violence. Few ever-married women (2\%) have ever initiated violence against their husband.

Although the prevalence of spousal violence is lower among more educated women, 1 in 12 women who have at least 12 years of schooling have experienced physical or sexual spousal violence. The contextual and intergenerational aspects of spousal violence are clear from the fact that women whose mothers were beaten by their fathers are more than twice as likely to be in abusive marriages themselves. Women whose husbands consume alcohol are much more likely than women whose husbands do not consume alcohol to experience spousal violence, especially if the husband often gets drunk. However, 15 percent of even women whose husbands do not drink alcohol have experienced physical or sexual spousal violence.

## Is alcohol use related to spousal physical or sexual violence? <br> Percentage of ever-married women experiencing violence

Over one-fifth ( $22 \%$ ) of women who have experienced spousal physical or sexual violence have suffered injuries as a result of the violence, and among women who have experienced both physical and sexual violence this proportion rises to 58 percent. The most common type of injury is cuts, bruises, or aches.

## Help seeking

Only 9 percent of women who have ever experienced physical or sexual violence by anyone have sought help. Almost four-fifths (79\%) of women have neither sought help nor told anyone about the violence. Abused women who have sought help most often seek help from their own families. Only 3 percent of abused women who sought help for the violence sought help from the police.

Table 1 Results of the household and individual interviews
Number of households, number of interviews with women and men, and response rates, according to residence, Maharashtra, 2015-16

## Table 6 School attendance

Percentage of de facto household population age 6-17 years attending school in the 2014-15 school year by sex and residence, according to selected background characteristics, Maharashtra, 2015-16

| Background characteristic | Male |  |  | Female |  |  | Total |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Urban | Rural | Total | Urban | Rural | Total | Urban | Rural | Total |
| Age |  |  |  |  |  |  |  |  |  |
| 6-10 (Primary) | 98.2 | 97.2 | 97.6 | 98.1 | 97.5 | 97.8 | 98.2 | 97.3 | 97.7 |
| 6-13 (Elementary) | 96.9 | 96.1 | 96.5 | 97.0 | 95.3 | 96.1 | 97.0 | 95.7 | 96.3 |
| 11-13 (Upper primary) | 94.8 | 94.4 | 94.6 | 95.7 | 92.0 | 93.8 | 95.3 | 93.2 | 94.2 |
| 14-15 (Secondary) | 87.7 | 86.2 | 86.9 | 80.9 | 82.4 | 81.7 | 84.5 | 84.4 | 84.4 |
| 16-17 (Higher secondary) | 64.6 | 61.4 | 62.9 | 60.4 | 49.4 | 54.6 | 62.7 | 55.8 | 59.0 |
| 11-14 years | 95.5 | 95.4 | 95.4 | 95.7 | 93.7 | 94.6 | 95.6 | 94.6 | 95.1 |
| 15-17 years | 78.2 | 74.6 | 76.3 | 72.9 | 69.0 | 70.8 | 75.7 | 71.9 | 73.7 |
| 6-14 years | 95.8 | 95.4 | 95.6 | 95.9 | 94.2 | 95.0 | 95.8 | 94.8 | 95.3 |
| 6-17 years | 89.2 | 88.3 | 88.7 | 87.8 | 85.4 | 86.5 | 88.5 | 86.9 | 87.7 |
| Religion |  |  |  |  |  |  |  |  |  |
| Hindu | 91.7 | 88.7 | 89.9 | 89.5 | 85.5 | 87.1 | 90.6 | 87.2 | 88.5 |
| Muslim | 81.4 | 82.2 | 81.6 | 81.5 | 78.8 | 80.9 | 81.4 | 80.6 | 81.2 |
| Buddhist/Neo-Buddhist | 92.4 | 89.8 | 91.0 | 90.9 | 89.4 | 90.1 | 91.7 | 89.6 | 90.6 |
| Other | 90.7 | (81.7) | 89.4 | 96.0 | (86.1) | 94.5 | 93.0 | 83.8 | 91.7 |
| Caste/tribe |  |  |  |  |  |  |  |  |  |
| Scheduled caste | 92.2 | 91.7 | 91.9 | 90.3 | 87.5 | 88.9 | 91.3 | 89.7 | 90.5 |
| Scheduled tribe | 84.9 | 79.5 | 80.4 | 82.0 | 76.8 | 77.7 | 83.4 | 78.2 | 79.0 |
| Other backward class | 91.6 | 90.8 | 91.1 | 91.7 | 89.0 | 90.1 | 91.6 | 89.9 | 90.6 |
| Other | 87.8 | 89.8 | 88.7 | 86.4 | 87.0 | 86.7 | 87.1 | 88.5 | 87.7 |
| Don't know | (75.6) | (85.4) | 78.8 | (76.0) | (79.2) | 76.8 | 75.8 | 82.6 | 77.8 |

Note: In this table, children's age refers to their age at the start of the 2014-15 school year (assumed here to be April 2014).
( ) Based on 25-49 unweighted cases

Table 7 Children's living arrangements and orphanhood
Percent distribution of de jure children under age 18 by their living arrangements, and percentage of children with one or both biological parents dead, according to background characteristics, Maharashtra, 2015-16

| Background characteristic | Living with both parents | Living with mother but not with father | Living with father but not with mother | Not living with either parent | Total | Percentage with one or both parents dead ${ }^{1}$ | Number <br> of children |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Age |  |  |  |  |  |  |  |
| <5 years | 94.3 | 4.3 | 0.5 | 0.9 | 100.0 | 1.3 | 9,653 |
| 5-9 years | 92.0 | 4.3 | 1.1 | 2.6 | 100.0 | 2.8 | 9,483 |
| 10-14 years | 87.9 | 7.0 | 1.4 | 3.6 | 100.0 | 6.6 | 10,490 |
| 15-17 years | 81.9 | 9.5 | 2.3 | 6.3 | 100.0 | 9.3 | 6,269 |
| Residence |  |  |  |  |  |  |  |
| Urban | 89.5 | 6.3 | 1.3 | 2.9 | 100.0 | 4.8 | 16,341 |
| Rural | 89.8 | 5.8 | 1.2 | 3.3 | 100.0 | 4.5 | 19,555 |
| Sex |  |  |  |  |  |  |  |
| Male | 90.3 | 6.0 | 1.2 | 2.4 | 100.0 | 4.5 | 18,701 |
| Female | 89.0 | 6.0 | 1.2 | 3.8 | 100.0 | 4.7 | 17,194 |
| Total age $<15$ years | 91.3 | 5.3 | 1.0 | 2.4 | 100.0 | 3.6 | 29,626 |
| Total age <18 years | 89.7 | 6.0 | 1.2 | 3.1 | 100.0 | 4.6 | 35,895 |

${ }^{1}$ Includes children with father dead, mother dead, both parents dead, and one parent dead but missing information on survival status of the other parent

Table 8 Birth registration of children under age five
Percentage of de jure children under age five years whose birth was registered with the civil authorities, according to background characteristics, Maharashtra, 2015-16

| Background characteristic | Percentage of children whose birth was registered |  |  | De jure children |
| :---: | :---: | :---: | :---: | :---: |
|  | Registered, has a birth certificate | Registered, does not have a birth certificate | Total registered |  |
| Age |  |  |  |  |
| <2 years | 68.5 | 25.1 | 93.6 | 3,636 |
| 2-4 years | 78.8 | 17.3 | 96.0 | 6,017 |
| Sex |  |  |  |  |
| Male | 75.2 | 20.2 | 95.4 | 4,990 |
| Female | 74.7 | 20.2 | 94.9 | 4,663 |
| Residence |  |  |  |  |
| Urban | 84.2 | 11.5 | 95.8 | 4,321 |
| Rural | 67.4 | 27.2 | 94.6 | 5,332 |
| Total | 74.9 | 20.2 | 95.1 | 9,653 |

Table 9 Birth registration of children under age five by district
Percentage of de jure children under age five years whose birth was registered with the civil authorities, by district, Maharashtra, 2015-16

| District | Percentage of children whose birth was registered |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Registered, has a birth certificate | Registered, does not have a birth certificate | Total registered | De jure children |
| Ahmadnagar | 65.8 | 27.5 | 93.4 | 411 |
| Akola | 79.9 | 18.8 | 98.7 | 153 |

| TFR (15-49) | 1.68 | 2.06 | 1.87 | 1.91 | 2.31 | 2.11 | 2.24 | 2.74 | 2.52 | 2.54 | 3.12 | 2.86 |
| CBR | 15.5 | 17.5 | 16.6 | 18.2 | 19.3 | 18.8 | 21.6 | 23.8 | 23.0 | 24.4 | 28.4 | 26.7 |

Note: Rates are for the period 1-36 months preceding the survey (approximately 1990-92 for NFHS-1, 1996-98 for NFHS-2, 2003-05 for NFHS-3, and 2013-15 for NFHS-4). Age-specific fertility rates are expressed per woman. Rates for the age group 45-49 might be slightly biased due to truncation.
TFR $=$ Total fertility rate, expressed per woman
CBR $=$ Crude birth rate, expressed per 1,000 population

Table 12 Fertility by background characteristics
Total fertility rate for the three years preceding the survey, percentage of women age 15-49 currently pregnant, mean number of children ever born to women age 40-49, and total wanted fertility rate, by background characteristics, Maharashtra, 2015-16

| Background characteristic | Total fertility rate | Percentage of women age 15-49 currently pregnant | Mean number of children ever born to women age 40-49 | Total wanted fertility rate |

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status.
AYUSH = Ayurveda, yoga and naturopathy, unani, siddha and homeopathy; UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare centre; $\mathrm{CHC}=$ Community health centre; $\mathrm{PHC}=$ Primary health centre; ANM $=$ Auxiliary nurse midwife; ICDS $=$ Integrated Child Development Services; ASHA = Accredited Social Health Activist; NGO $=$ Nongovernmental organization; $\mathrm{TBA}=$ Traditional birth attendant IUD = Intrauterine device; PPIUD = Postpartum intrauterine device
${ }^{1}$ Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods
( ) Based on 25-49 unweighted cases

* Percentage not shown; based on fewer than 25 unweighted cases

## Table 26 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the five years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, and the percentage who were ever told by a health or family planning worker about other methods of family planning they could use, by method, according to residence, Maharashtra, 2015-16

| Method | Percentage who were informed about possible side effects or problems of method used | Percentage who were informed about what to do if they experienced side effects | Percentage who were ever told by a health or family planning worker of other methods that could be used | Number of women |
| :---: | :---: | :---: | :---: | :---: |
| URBAN |  |  |  |  |
| Female sterilization ${ }^{1}$ | 37.1 | 30.4 | 41.6 | 953 |

| Total | 4.3 | 5.4 | 9.7 | 5.2 | 59.5 | 64.7 | 9.5 | 64.9 | 74.5 | 87.0 | 84.0 | 21,518 |

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop正 become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.
Total demand is the sum of unmet need and met need
${ }^{2}$ Percentage of demand satisfied is met need divided by to
${ }^{3}$ Modern methods include female sterilization, male sterilization, pill, IUD/PPIUD, injectables, male condom, female condom, standard days method, diaphragm, foam/jelly, lactational amenorrhoea method (LAM), and other modern methods

Table 30 Unmet need for family planning by district
Percentage of currently married women age 15-49 with unmet need for family planning by district, Maharashtra, 2015-16, and total for NFHS-3

| District | Total unmet need | Unmet need for spacing | Unmet need for limiting | Number of women |

| NFHS-3 (2005-06) | 10.0 | 5.3 | 4.7 | 6,606 |

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.

Table 31 Pregnancy outcome
Percent distribution of last pregnancies among women age 15-49 during the five years preceding the survey by pregnancy outcome, according to background characteristics, Maharashtra, 2015-16

|  | Pregnancy outcome |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | ---: |
|  | Background characteristic | Live birth | Abortion | Miscarriage | Stillbirth | Total | \(\left.\begin{array}{l}Number of <br>

pregnancies\end{array}\right]\)

Note: If more than one source of ANC was mentioned, only the provider with the highest qualification is considered in this table.
ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant; ICDS = Integrated Child Development Services;
ASHA $=$ Accredited Social Health Activist
${ }^{1}$ Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife and lady health visitor
( ) Based on 25-49 unweighted cases

Table 38 Antenatal care services and information received
Percentage of women who had a live birth in the five years preceding the survey who received antenatal care (ANC) for the most recent live birth by services and information received, according to residence and source of antenatal care, Maharashtra, 2015-16

| Services/information | Residence |  | Source of ANC |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Urban | Rural | Public health sector | Private health sector ${ }^{1}$ | Both public and private health sector ${ }^{1}$ | ANC received only at home |  |
| Percentage receiving selected services during antenatal care |  |  |  |  |  |  |  |
| Weighed | 99.2 | 97.6 | 98.0 | 99.3 | 99.1 | 97.5 | 98.3 |
| Blood pressure measured | 99.0 | 96.8 | 97.0 | 99.1 | 98.5 | 97.3 | 97.8 |
| Urine sample taken | 99.0 | 96.7 | 96.9 | 99.1 | 98.7 | 97.4 | 97.7 |

## Table 51 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present for at least one antenatal check-up, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Maharashtra, 2015-16

| Antenatal and delivery care information | Urban | Rural | Total |
| :--- | ---: | ---: | ---: |
| Percentage of men for whom the youngest child's mother received antenatal care | 93.8 | 91.0 | 92.3 |
| Percentage of men who were present at any antenatal check-up | 84.1 | 78.6 | 81.1 |
| Percentage who were told by a health provider or worker about the following signs |  |  |  |
| of pregnancy complications: | 46.9 | 40.0 |  |
| Vaginal bleeding | 38.0 | 29.0 | 43.1 |
| Convulsions | 54.5 | 47.6 | 50.6 |
| Prolonged labour | 57.5 | 55.0 | 56.1 |
| Severe abdominal pain | 56.6 | 47.1 | 51.3 |
| High blood pressure | 67.7 | 52.8 | 59.4 |
| Percentage ever told what to do if the mother had any pregnancy complications | 94.9 | 89.5 | 91.9 |

Percentage to whom a health provider or worker spoke about the following aspects of maternal care:

| The importance of delivering in a health facility | 75.8 | 70.0 | 72.6 |
| :--- | :--- | :--- | :--- |
| The importance of proper nutrition for the mother during pregnancy | 89.0 | 80.7 | 84.4 |
| Family planning or delaying his next child | 73.3 | 69.3 | 71.1 |
| Number of men with a youngest child age 0-35 months | 369 | 462 | 831 |

Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of:

| Cord care | $*$ | 42.5 | 34.9 |
| :--- | :---: | :---: | :---: |
| Breastfeeding the baby immediately after delivery | $*$ | 48.7 | 42.3 |
| Keeping the baby warm immediately after birth | $*$ | 42.3 | 37.1 |
| Number of men whose youngest child age 0-35 months was not delivered in a health facility | 19 | 49 | 68 |

[^11]Table 52 Vaccinations by background characteristics
Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), and percentage with a
Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), and percentage with

Note: Total includes children of birth order 6 or more, children belonging to "other" religions and children whose caste/tribe is not known, who are not shown separately
$\mathrm{na}=$ Not available
${ }^{1}$ Polio 0 is the polio vaccination given at birth and hepatitis B 0 is the hepatitis vaccination given at birth
${ }^{2}$ Fully vaccinated with BCG, measles, and three doses each of DPT and polio vaccine (excluding polio vaccine given at birth)

Table 53 Selected vaccinations by district
Percentage of children age 12-23 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report) percentage who received most vaccinations in a public health facility by district, Maharashtra, 2015-16

| District | 3 doses of Hepatitis B | BCG | 3 doses <br> of DPT | 3 doses of polio | Measles | All basic vaccinations ${ }^{1}$ | No vaccinations ${ }^{2}$ | Number of children | Percentage who received most vaccinations in a public facility | Number of children who received any vaccinations |

Table 56 Feeding practices during diarrhoea-Continued
Percent distribution of children under age five who had diarrhoea in the two weeks preceding the survey by amount of liquids and food given compared with normal practice, according to background characteristics, Maharashtra, 2015-16

| Background characteristic | Amount of liquids given |  |  |  |  |  | Total | Amount of food given |  |  |  |  |  |  | Total | Percentage given increased fluids and continued feeding ${ }^{1}$ | Percentage given ORT and continued feeding ${ }^{1}$ | Number of children with diarrhoea |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | More | $\begin{gathered} \text { Same } \\ \text { as } \\ \text { usual } \end{gathered}$ | Somewhat less | Much less | None | Don't <br> know |  | More | Same <br> as <br> usual | Somewhat less | Much less | None | Never gave food | Don't <br> know |  |  |  |  |
| Caste/tribe |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Scheduled caste | 6.2 | 22.7 | 32.6 | 33.5 | 3.9 | 1.1 | 100.0 | 5.0 | 25.8 | 35.0 | 28.4 | 0.4 | 5.3 | 0.3 | 100.0 | 5.2 | 51.4 | 175 |
| Scheduled tribe | 17.2 | 16.8 | 45.3 | 16.1 | 3.8 | 0.9 | 100.0 | 11.8 | 16.7 | 41.4 | 17.3 | 0.0 | 11.9 | 1.0 | 100.0 | 14.2 | 50.6 | 112 |
| Other backward class | 8.6 | 31.1 | 37.7 | 20.1 | 2.6 | 0.0 | 100.0 | 4.0 | 31.2 | 40.3 | 20.5 | 0.6 | 3.3 | 0.0 | 100.0 | 6.9 | 56.9 | 166 |
| Other | 18.6 | 29.3 | 34.5 | 12.1 | 5.1 | 0.4 | 100.0 | 8.8 | 27.5 | 37.1 | 16.3 | 4.4 | 5.8 | 0.1 | 100.0 | 13.1 | 55.1 | 306 |
| Total | 13.4 | 26.3 | 36.4 | 19.3 | 4.1 | 0.5 | 100.0 | 7.2 | 26.2 | 38.1 | 20.2 | 2.0 | 6.0 | 0.2 | 100.0 | 10.1 | 53.8 | 764 |

Note: It is recommended that children should be given more liquids to drink during diarrhoea and food should not be reduced. Total includes children belonging to "other" religions and children whose caste/tribe is not known, who are not shown separately.
ORT = Oral rehydration therapy, which includes a solution prepared from an oral rehydration salt (ORS) packet and/or gruel and/or increased fluids ${ }^{1}$ Continued feeding includes children who were given more, same as usual, or somewhat less food during the diarrhoea episode

Table 57 Knowledge of ORS packets
Percentage of all women and percentage of women who had a live birth in the five years preceding the survey who know about ORS packets for treatment of diarrhoea, by background characteristics, Maharashtra, 2015-16

| Background characteristic | All women |  | Women who gave birth in the past five years |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Percentage who know about ORS packets | Number of women | Percentage who know about ORS packets | Number of women |

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards adopted in 2006. The indices in this table are NOT comparable to those based on the previously used 1977 NCHS/CDC/WHO Reference. Table is based on children with valid dates of birth month and year) and valid measurement of both height and weight.
Recumbent length is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm ; standing height is measured for all other children Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median
Excludes children whose mothers were not interviewed
${ }^{5}$ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
${ }^{6}$ Includes children whose mothers are deceased
${ }^{7}$ Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months.
Mother's nutritional status in terms of BMI (Body Mass Index) is presented in Table 70

## Table 61 Initial breastfeeding

Among last-born children who were born in the two years preceding the survey, the percentage who were ever breastfed, and the percentage who started breastfeeding within one hour and one day of birth, and among last-born children born in the two years preceding the survey who were ever breastfed, the percentage who received a prelacteal feed, by background characteristics, Maharashtra, 2015-16

| Background characteristic | Among last-born children born in the past two years: |  |  |  | Among last-born children born in the past two years who were ever breastfed: |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 18-23 | 35.1 | 2.9 | 0.8 | 0.7 | 3.0 | 57.5 | 100.0 | 64.9 | 808 | 21.6 | 865 |
| <4 | 4.4 | 64.5 | 9.8 | 1.0 | 5.3 | 15.0 | 100.0 | 95.6 | 426 | 10.3 | 429 |
| $<6$ | 4.5 | 56.6 | 14.6 | 1.3 | 6.6 | 16.4 | 100.0 | 95.5 | 718 | 12.7 | 722 |
| 6-9 | 7.4 | 12.0 | 12.8 | 6.0 | 10.8 | 51.0 | 100.0 | 92.6 | 628 | 20.4 | 632 |
| 12-15 | 14.9 | 2.9 | 2.6 | 3.9 | 5.7 | 70.0 | 100.0 | 85.1 | 575 | 19.2 | 585 |
| 12-23 | 25.1 | 2.8 | 2.1 | 2.1 | 4.1 | 63.7 | 100.0 | 74.9 | 1,683 | 19.0 | 1,755 |
| 20-23 | 35.8 | 3.6 | 0.4 | 0.7 | 3.4 | 56.2 | 100.0 | 64.2 | 559 | 20.6 | 599 |

Note: Breastfeeding status refers to a "24-hour" period (yesterday and last night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus children who receive breastmilk and non-milk liquids and who do not receive other milk and who do not receive complementary foods are
classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding as well. classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding as well.
Table 63 Median duration of breastfeeding and infant and young child feeding (IYCF) practices
 practices based on the number of food groups and times they were fed during the day or night preceding the survey, by breastfeeding status and background characteristics, Maharashtra, 2015-16

| Background characteristic | Median duration (months) of breastfeeding among last-born children born in the last three years ${ }^{1}$ |  |  |  | Among breastfed children 6-23 months, percentage fed: |  |  |  | Among nonbreastfed children 6-23 months, percentage fed: |  |  |  |  | Among all children 6-23 months, percentage fed: |  |  |  |  |

Table 65 Prevalence of anaemia in children-Continued
Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Maharashtra, 2015-16 and total for NFHS-3

| Background characteristic | Anaemia status by haemoglobin level |  |  | Any anaemia$(<11.0 \mathrm{~g} / \mathrm{dl})$ | Number of children |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { Mild } \\ (10.0-10.9 \mathrm{~g} / \mathrm{dl}) \end{gathered}$ | $\begin{gathered} \text { Moderate } \\ (7.0-9.9 \mathrm{~g} / \mathrm{dl}) \end{gathered}$ | $\begin{gathered} \text { Severe } \\ (<7.0 \mathrm{~g} / \mathrm{dl}) \\ \hline \end{gathered}$ |  |  |
| Child's living arrangements |  |  |  |  |  |
| Living with both parents | 27.8 | 24.8 | 1.1 | 53.6 | 6,924 |
| Living with one or neither parent | 27.0 | 27.1 | 1.5 | 55.6 | 805 |
| Mother's anaemia status ${ }^{4}$ |  |  |  |  |  |
| Not anaemic | 26.7 | 20.0 | 1.0 | 47.7 | 3,591 |
| Mildly anaemic | 29.2 | 26.5 | 1.1 | 56.8 | 3,063 |
| Moderately/severely anaemic | 27.5 | 40.7 | 1.7 | 70.0 | 817 |
| Total | 27.7 | 25.0 | 1.1 | 53.8 | 7,729 |
| NFHS-3 (2005-06) | 21.9 | 39.6 | 1.8 | 63.4 | 2,269 |

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl).
${ }^{1}$ Excludes children whose mothers were not interviewed
${ }^{2}$ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule
${ }^{3}$ Includes children whose mothers are deceased
${ }^{4}$ Mildly anaemic is classified as $10.0-11.9 \mathrm{~g} / \mathrm{dl}$ for non-pregnant women and $10.0-10.9 \mathrm{~g} / \mathrm{dl}$ for pregnant women. Moderately/severely anaemic is $<10.0 \mathrm{~g} / \mathrm{dl}$. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known
Table 66 Micronutrient intake among children
Percentage of youngest children age 9-23 months living with the mother who consumed vitamin A-rich and iron-rich foods in the day or night preceding the survey, percentage of children age 9-59 months who were given vitamin A supplements in the six months preceding the survey and percentage of children age $6-59$ months who were given iron supplements in the past seven days, who were given deworming medication in the six months preceding the survey, and who live in households using iodized salt, by background characteristics, Maharashtra, 2015-16, and total for NFHS-3

| Background characteristic | Youngest children age 9-23 months living with their mother |  |  | Children age 9-59 months |  | Children age 6-59 months |  |  | Children age 6-59 months in households with salt tested |  |

| Age 50-54 | 35.2 | 25.7 | 44.5 | 21.4 | 5.1 | 3.2 | 100.0 | 3.0 | 301 |
| Total age 15-54 | 18.9 | 41.8 | 41.3 | 12.3 | 3.7 | 1.0 | 100.0 | 0.7 | 4,513 |

Note: Total includes men who don't know their caste/tribe, who are not shown separately.
SBP $=$ Systolic blood pressure ; DBP $=$ Diastolic blood pressure
${ }^{1}$ A man is classified as having hypertension if he has $S B P \geq 140 \mathrm{mmHg}$ or $\mathrm{DBP} \geq 90 \mathrm{mmHg}$ at time of survey, or he is currently taking antihypertensive medication to control his blood pressure. The term
hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

Table 84.1 Random blood glucose levels: Women
Among women age 15-49, percent distribution of random blood glucose values, by background characteristics, Maharashtra, 2015-16

## Table 99 Spousal violence by husband's characteristics and empowerment indicators-Continued

Percentage of ever-married women age 15-49 who have ever suffered emotional, physical, or sexual violence committed by their husband, according to his characteristics, marital characteristics, and selected empowerment indicators, Maharashtra, 2015-16

| Background characteristic | Emotional violence | Physical violence | Sexual violence | Physical or sexual violence | Emotional, physical, or sexual violence | Number of women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Number of reasons given for refusing to have sexual intercourse with husband ${ }^{5}$ |  |  |  |  |  |  |
| 0 | 3.2 | 10.4 | 1.7 | 10.4 | 10.8 | 223 |
| 1-2 | 22.6 | 37.4 | 5.9 | 39.0 | 41.1 | 219 |
| 3 | 9.1 | 20.5 | 1.9 | 20.6 | 22.6 | 2,031 |
| Afraid of husband |  |  |  |  |  |  |
| Most of the time | 31.2 | 46.2 | 9.0 | 46.2 | 48.0 | 230 |
| Sometimes | 7.9 | 20.9 | 1.5 | 21.2 | 22.6 | 1,609 |
| Never | 6.8 | 12.4 | 1.7 | 12.7 | 15.5 | 633 |
| Total | 9.8 | 21.1 | 2.3 | 21.4 | 23.2 | 2,472 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.
${ }^{1}$ Currently married women only
${ }^{2}$ Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money
${ }^{3}$ Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives
${ }^{4}$ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws
${ }^{5}$ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood
( ) Based on 25-49 unweighted cases

Table 100 Injuries to women due to spousal violence
Percentage of ever-married women age 15-49 who have experienced spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Maharashtra, 2015-16

| Type of spousal violence experienced | Percentage of women who have had: |  |  |  |  | Number of ever-married women |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Cuts, bruises, or aches | Severe burns | Eye injuries, sprains, dislocations, or minor burns | Deep wounds, broken bones, broken teeth, or any other serious injury | Any of these injuries |  |
| Experienced physical violence ${ }^{1}$ |  |  |  |  |  |  |
| Ever ${ }^{2}$ | 20.2 | 1.3 | 3.7 | 2.7 | 21.8 | 520 |
| In the past 12 months | 23.0 | 1.7 | 3.7 | 3.2 | 24.8 | 362 |
| Experienced sexual violence |  |  |  |  |  |  |
| Ever ${ }^{2}$ | 48.7 | 5.2 | 16.6 | 9.9 | 50.2 | 56 |
| In the past 12 months | 50.1 | 7.2 | 19.6 | 11.1 | 52.1 | 41 |
| Experienced physical or sexual violence |  |  |  |  |  |  |
| Ever ${ }^{2}$ | 19.9 | 1.3 | 3.7 | 2.7 | 21.5 | 528 |
| In the past 12 months | 22.6 | 1.7 | 3.6 | 3.2 | 24.4 | 369 |
| Experienced physical and sexual violence |  |  |  |  |  |  |
| Ever ${ }^{2}$ | 56.1 | 6.0 | 19.1 | 11.5 | 57.7 | 49 |
| In the past 12 months | 59.1 | 8.5 | 23.2 | 13.1 | 61.5 | 35 |
| Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. <br> ${ }^{1}$ Excludes women who reported violence only in response to a direct question on violence during pregnancy <br> ${ }^{2}$ Includes violence in the past 12 months |  |  |  |  |  |  |

Table 101 Help seeking
Percentage of women age 15-49 who have ever experienced physical or sexual violence by whether they have ever sought help, and among those who have sought help from any source, the source from which help was sought, according to the type of violence experienced and marital status, Maharashtra, 2015-16

| Source | Type of violence experienced |  | Marital status |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Physical only | Both physical and sexual | Ever-married | Never married |  |
| Help seeking |  |  |  |  |  |
| Never sought help and never told anyone | 81.2 | 60.5 | 81.1 | (54.3) | 78.9 |
| Never sought help but told someone | 11.9 | 11.8 | 11.3 | (26.5) | 12.6 |
| Sought help | 6.9 | 27.7 | 7.6 | (19.2) | 8.6 |
| Number of women who experienced violence | 579 | 61 | 608 | 54 | 662 |
| Sources of help among those who sought any help ${ }^{1}$ |  |  |  |  |  |
| Own family | (52.1) | * | 58.3 | * | 47.6 |
| Husband's family | (27.0) | * | 24.7 | * | 20.2 |
| Current/former husband | (1.9) | * | 1.6 | * | 1.3 |
| Friend | (18.4) | * | 12.4 | * | 17.3 |

| Lawyer | (0.5) | * | 1.4 | * | 1.1 |
| Social service organization | (1.6) | * | 4.9 | * | 15.2 |
| Number of women who experienced violence and sought help | 40 | 17 | 46 | 10 | 57 |

[^25]
## APPENDIX

## ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fourth National Family Health Survey (NFHS-4) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-4 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-4 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-4 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, $r=y / x$, where y represents the total sample value for variable $y$, and $x$ represents the total number of cases in the group or subgroup under consideration. The variance of $r$ is computed using the formula given below, with the standard error being the square root of the variance:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1-f}{x^{2}} \sum_{h=1}^{H}\left[\frac{m_{h}}{m_{h}-1}\left(\sum_{i=1}^{m_{h}} z_{h i}^{2}-\frac{z_{h}^{2}}{m_{h}}\right)\right]
$$

in which

$$
z_{h i}=y_{h i}-r x_{h i}, \text { and } z_{h}=y_{h}-r x_{h}
$$

where $h \quad$ represents the stratum, which varies from 1 to $H$,
$m_{h}$ is the total number of clusters selected in the $h^{\text {th }}$ stratum,
$y_{h i}$ is the sum of the weighted values of variable $y$ in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum,
$x_{h i} \quad$ is the sum of the weighted number of cases in the $i^{\text {th }}$ cluster in the $h^{\text {th }}$ stratum, and
$f \quad$ is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-4 sample for Maharashtra, there were 1,343 clusters. Hence, 1,343 replications were created. The variance of a rate $r$ is calculated as follows:

$$
S E^{2}(r)=\operatorname{var}(r)=\frac{1}{k(k-1)} \sum_{i=1}^{k}\left(r_{i}-r\right)^{2}
$$

in which

$$
r_{i}=k r-(k-1) r_{(i)}
$$

where $r \quad$ is the estimate computed from the full sample of 1,343 clusters,
$r_{(i)} \quad$ is the estimate computed from the reduced sample of 1,342 clusters ( $i^{\text {th }}$ cluster excluded), and
$k \quad$ is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater
than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ) for each estimate are also computed.

Sampling errors for NFHS-4 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Maharashtra as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A. 2 presents the value of the statistic (R), its standard error (SE), the number of unweighted ( N ) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits ( $\mathrm{R} \pm 2 \mathrm{SE}$ ); for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1 ).

| Variable | Estimate | Base population |
| :---: | :---: | :---: |
| HOUSEHOLDS |  |  |
| Using an improved source of drinking water | Proportion | Households |
| Using an improved sanitation facility | Proportion | Households |
| Using iodized salt | Proportion | Households |
| Sex ratio (females per 1,000 males) | Ratio | De facto household population, all ages |
| WOMEN |  |  |
| No schooling (Females age 6 years and above) | Proportion | De facto household population of females age 6 and above |
| Urban residence | Proportion | Women age 15-49 |
| No schooling (Women age 15-49) | Proportion | Women age 15-49 |
| Completed 10 or more years of schooling | Proportion | Women age 15-49 |
| Never married, including married gauna not performed | Proportion | Women age 15-49 |
| Currently married | Proportion | Women age 15-49 |
| Married before age 18 | Proportion | Women age 20-49 |
| Currently using any contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using a modern contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using a traditional contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using pill | Proportion | Currently married women age 15-49 |
| Currently using IUD/PPIUD | Proportion | Currently married women age 15-49 |
| Currently using condom/Nirodh | Proportion | Currently married women age 15-49 |
| Currently using female sterilization | Proportion | Currently married women age 15-49 |
| Using public health sector source of contraception | Proportion | Women age 15-49 currently using modern methods of contraception |
| Unmet need for family planning | Proportion | Currently married women age 15-49 |
| Want no more children | Proportion | Currently married women age 15-49 |
| Want to delay next birth at least 2 years | Proportion | Currently married women age 15-49 |
| Mother received four or more antenatal care (ANC) visits | Proportion | Women with at least one birth in last five years (last birth) |
| Took iron and folic acid (IFA) for 100 days or more | Proportion | Women with at least one birth in last five years (last birth) |
| Birth registration | Proportion | De jure children under age 5 years |
| Births delivered by a health personnel | Proportion | Births in last 5 years |
| Institutional delivery | Proportion | Births in last 5 years |
| Postnatal check for mother within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Postnatal check for newborn within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Exclusive breastfeeding | Proportion | Children under age 6 months |
| Children with diarrhoea | Proportion | Children under age 5 years |
| Treated with oral rehydration salt (ORS) packets | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Children with diarrhoea taken to a health provider | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Child received BCG vaccination | Proportion | Children age 12-23 months |
| Child received DPT vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received polio vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received measles vaccination | Proportion | Children age 12-23 months |
| Child received hepatitis B vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child with all basic vaccinations | Proportion | Children age 12-23 months |
| Children given vitamin A supplement in past 6 months | Proportion | Children age 9-59 months |
| Height-for-age, stunting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-height, wasting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-age, underweight (below -2SD) | Proportion | Children under age 5 years who were measured |
| Children with any anaemia | Proportion | Children age 6-59 months with an anaemia test |
| Women with any anaemia | Proportion | Women age 15-49 with an anaemia test |
| Body mass index (BMI) $<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women age 15-49 who were measured |
| Body mass index (BMI) $\geq 25.0 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Women age 15-49 who were measured |
| Have heard of HIV/AIDS | Proportion | Women age 15-49 |
| Have comprehensive knowledge about HIVIAIDS | Proportion | Women age 15-49 |
| Ever experienced physical or sexual violence | Proportion | Women age 15-49 |
| Total fertility rate (last 3 years) | Rate | Women |
| Neonatal mortality | Rate | Births in last 5 years |
| Postneonatal mortality | Rate | Births in last 5 years |
| Infant mortality | Rate | Births in last 5 years |
| Child mortality | Rate | Births in last 5 years |
| Under-five mortality | Rate | Births in last 5 years |
| MEN |  |  |
| No schooling (Males age 6 years and above) | Proportion | De facto household population of males age 6 and above |
| Urban residence | Proportion | Men age 15-49 |
| No schooling (Men age 15-49) | Proportion | Men age 15-49 |
| Completed 10 or more years of schooling | Proportion | Men age 15-49 |
| Never married, including married gauna not performed | Proportion | Men age 15-49 |
| Currently married | Proportion | Men age 15-49 |
| Married before age 21 | Proportion | Men age 25-49 |
| Want no more children | Proportion | Currently married men age 15-49 |
| Want to delay next birth at least 2 years | Proportion | Currently married men age 15-49 |
| Men with any anaemia | Proportion | Men age 15-49 with an anaemia test |
| Body mass index (BMI) $<18.5 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Men age 15-49 who were measured |
| Body mass index (BMI) $\geq 25.0 \mathrm{~kg} / \mathrm{m}^{2}$ | Proportion | Men age 15-49 who were measured |
| Have heard of HIVIAIDS | Proportion | Men age 15-49 |
| Have comprehensive knowledge about HIV/AIDS | Proportion | Men age 15-49 |

[^0]:    na $=$ Not applicable
    ${ }^{1}$ Females per 1,000 males
    ${ }^{2}$ Population age 6 and above

[^1]:    na $=$ Not applicable
    ${ }^{1}$ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals
    ${ }^{2}$ Protected dug well, protected spring, rainwater, community RO plant
    ${ }^{3}$ Surface water, unprotected dug well, unprotected spring, cart with small tank, tanker truck, bottled water
    ${ }^{4}$ Total may add to more than 100.0 because households may use more than one method of purification
    ${ }^{5}$ Appropriate water treatment methods include boiling, bleaching, filtering, and electronic purifying
    ${ }^{6}$ Includes ventilated improved pit (VIP)/biogas latrine and twin pit/composting toilet
    ${ }^{7}$ Facilities that would be considered improved if they were not shared by two or more households
    ${ }^{8}$ Includes dry toilet
    ${ }^{9}$ Houses made from mud, thatch, or other low-quality materials are called kachha houses, houses that use partly low-quality and partly high-quality materials are called semi-pucca houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called pucca houses
    ${ }^{10}$ Electricity, LPG/natural gas, or biogas
    ${ }^{11}$ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes
    ${ }^{12}$ Frequency of smoking by anyone inside the house

[^2]:    BPL = Below poverty line
    ${ }^{1}$ Cows, bulls, buffaloes, camels, horses, donkeys, mules, goats, sheep, chickens, or ducks
    ${ }^{2}$ Percentage of households in which any usual member of the household has a bank account/post office account
    ${ }^{3}$ Percentage of households in which any usual member of the household is covered by a health scheme/health insurance

[^3]:    Note: First-order births are excluded from the table. The interval for multiple births is the number of months since the preceding pregnancy that ended in a live birth.
    ( ) Based on 25-49 unweighted cases

[^4]:    ${ }^{1}$ Includes pill, IUD/PPIUD, injectables, male condom, female condom, and lactational amenorrhoea method (LAM)
    ${ }^{2}$ Includes rhythm, withdrawal, and other traditional methods

[^5]:    Note: Figures are based on life table calculations using information on episodes of contraceptive use that began 3-62 months preceding the survey. All methods includes male sterilization, which is not shown separately
    IUD $=$ Intrauterine device; PPIUD $=$ Postpartum intrauterine device
    ${ }^{1}$ Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation
    ${ }^{2}$ Includes lack of access/too far, costs too much, and inconvenient to use
    ${ }^{3}$ Reasons for discontinuation are mutually exclusive and add to the total in this column
    ${ }^{4}$ The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within two months of discontinuation
    ${ }^{5}$ Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation
    ${ }^{6}$ Includes injectables, female condom, diaphragm, foam/jelly, standard days method, LAM, withdrawal, rhythm, and other modern and traditional methods not shown separately
    ${ }^{7}$ Includes other modern spacing methods that are not shown separately
    ${ }^{8}$ Includes other spacing methods that are not shown separately

[^6]:    Note: Risk ratio is the ratio of the proportion dead among births in a specific high-risk category to the proportion dead among births not in any high-risk category.
    na $=$ Not applicable
    ${ }^{1}$ Women are assigned to risk categories according to the status they would have at the birth of a child if they were to conceive at the time of the survey: current age less than 17 years and 3 months or greater than 34 years and 2 months, latest birth less than 15 months ago, or latest birth of order 3 or higher
    ${ }^{2}$ Includes the category age $<18$ and birth order $>3$
    ${ }^{\text {a }}$ Includes sterilized women
    ( ) Based on 25-49 unweighted cases

    * Based on fewer than 25 unweighted cases

[^7]:    Note: Total includes births delivered in an "other" place of delivery, which are not shown separately.
    na $=$ Not applicable
    ${ }^{1}$ Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.
    ${ }^{2}$ Based on the last live birth in the five years preceding the survey
    ${ }^{3}$ Postnatal checks are checks on the woman's health within 42 days of the birth
    ${ }^{4}$ Includes nongovernmental organizations or trust hospitals/clinics
    ( ) Based on 25-49 unweighted cases

[^8]:    ${ }^{1}$ Excludes women who don't know the cost
    ( ) Based on 25-49 unweighted cases

[^9]:    Note: Total includes information on births to women who delivered in an "other" place of delivery, which are not shown separately.
    ${ }^{1}$ Includes newborns who received a health check after the first week
    ${ }^{2}$ Includes nongovernmental organizations or trust hospitals/clinics
    ( ) Based on 25-49 unweighted cases

[^10]:    ${ }^{1}$ Based on the last birth to women in the three years preceding the survey
    ${ }^{2}$ Full antenatal care includes having received at least four antenatal care visits, at least one tetanus toxoid (TT) injection and having taken iron and folic acid (IFA) tablets or syrup for 100 or more days
    ${ }^{3}$ Based on all births in the three years preceding the survey
    ${ }^{4}$ Doctor, auxiliary nurse midwife (ANM), nurse, midwife, lady health visitor (LHV), or other health personnel

[^11]:    * Percentage not shown; based on fewer than 25 unweighted cases

[^12]:    ${ }^{1}$ Symptoms of ARI (cough accompanied by short, rapid breathing or difficulty breathing, which was chest related)
    ${ }^{2}$ Excludes pharmacy, shop, and traditional healer
    () Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^13]:    ${ }^{1}$ Supplementary food includes both food cooked and served at the AWC on a daily basis and food given in the form of take home rations ${ }^{2}$ Services are usually provided to breastfeeding mothers during the first six months of breastfeeding

[^14]:    Note: Table is based on last-born children born in the last two years whether the children are living or dead at the time of interview. Total includes children whose caste/tribe is not known and children who were delivered in an "other" place of delivery, who are not shown separately.
    TBA = Traditional birth attendant
    ${ }^{1}$ Includes children who started breastfeeding immediately after birth
    ${ }^{2}$ Includes children who started breastfeeding within one hour of birth
    ${ }^{3}$ Children given something other than breastmilk during the first three days of life
    ${ }^{4}$ Doctor, nurse, midwife, auxiliary nurse midwife, lady health visitor, or other health personnel
    ( ) Based on 25-49 unweighted cases

[^15]:    Note: The Body Mass Index (BMI) is expressed as the ratio of weight in kilograms to the square of height in meters $\left(\mathrm{kg} / \mathrm{m}^{2}\right)$.
    na $=$ Not applicable
    ${ }^{1}$ Excludes pregnant women and women with a birth in the preceding 2 months
    ( ) Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^16]:    () Based on 25-49 unweighted cases

[^17]:    ${ }^{1}$ Comprehensive knowledge means knowing that consistent use of condoms every time they have sex and having just one uninfected faithful sex partner can reduce the chance of getting HIV/AIDS, knowing that a healthy-looking person can have HIV/AIDS, and rejecting two common misconceptions about transmission or prevention of HIV/AIDS
    ${ }^{2}$ Sexual intercourse with a partner who was neither a spouse nor lived with the respondent
    ( ) Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^18]:    ${ }^{1}$ Includes medically treated tuberculosis
    ${ }^{2}$ Suffering from tuberculosis and received medical treatment
    ${ }^{3}$ Includes coal, lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes

[^19]:    ${ }^{1}$ A woman is classified as having hypertension if she has $\mathrm{SBP} \geq 140 \mathrm{mmHg}$ or DBP $\geq 90 \mathrm{mmHg}$ at the time of the survey, or she is currently taking antihypertensive medication to control her blood pressure. The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

[^20]:    Note: Table is based on women age 15-24 who have ever menstruated.
    ${ }^{1}$ Respondents may report multiple methods so the sum may exceed 100 percent
    ${ }^{2}$ Locally prepared napkins, sanitary napkins and tampons are considered to be hygienic methods of protection
    () Based on 25-49 unweighted cases

[^21]:    na $=$ Not applicable

[^22]:    Note: Total includes women and men who don't know their caste/tribes, who are not shown separately.
    ${ }^{1}$ Nuclear households are households comprised of a married couple or a man or a woman living alone or
    ${ }^{1}$ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals. () Based on 25-49 unweighted cases

    * Percentage not shown; based on few

[^23]:    Note: Total includes women and men who don't know their caste/tribe, who are not shown separately.
    na = Not applicable

[^24]:    Note: All women were asked about their experience of physical violence since age 15. Ever-married women were also asked about their experience of spousal physical violence at any age.
    ${ }^{1}$ Women can report more than one person who committed the violence
    () Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases

[^25]:    ${ }^{1}$ Women can report more than one source from which they sought help
    ( ) Based on 25-49 unweighted cases

    * Percentage not shown; based on fewer than 25 unweighted cases
